### in Australia 2009–10

A statistical overview

#### Aged care statistics series number 35

Australian Institute of Health and Welfare, Canberra AIHW cat no. AGE 66 The Australian Institute of Health and Welfare is a major national agency which provides reliable, regular and relevant information and statistics on Australia's health and welfare. The Institute's mission is authoritative information and statistics to promote better health and wellbeing.

### Summary

This report focuses on the residential aged care system in Australia, which is regulated and principally funded by the Australian Government. Some information on community-based aged care is included for context and completeness.

#### Residential care provision broadly on target

- The number of residential aged care places continues to increase, with over 182,850 operational residential places at 30 June 2010 compared to around 178,300 places in 2009, and an average occupancy over the year of 92.3%.
- The provision ratio for residential aged care places fell slightly compared with the previous year, and is just below the government's target for 2011. The government has a planning target of 88 places per 1,000 by June 2011. At 30 June 2010, the provision ratio for residential aged care places was 86.8 places per 1,000 people aged 70 years or more, compared to 87.0 places the previous year.
- The provision ratio for residential aged care places and community aged care packages combined was 111.2 places per 1,000 people aged 70 years or over in 2010 compared to 110.1 in 2009. The government's target is 113 places per 1,000 by June 2011.

#### Residents—mostly with high care needs and mostly women—over half are 85+

- At 30 June 2010, there were nearly 166,400 residents in mainstream residential aged care services.
- 70% of all residents were female.
- Over half of all residents were aged 85 years or over.
- Seven out of ten permanent residents (71%) were assessed as 'high-care' and the remainder as 'low-care'.

#### Government spending on aged care services is substantial

- In 2009–10, the total recurrent Australian and state and territory government expenditure on residential aged care services was \$7.3 billion, with the Australian Government the dominant funder (estimated \$7.1 billion).
- Across jurisdictions, annual recurrent Australian Government expenditure on residential aged care per person aged 70 years and over was highest in South Australia (\$3,988), and lowest in the Australian Capital Territory(\$2,749), compared to the Australian average of \$3,367.

#### Indigenous use of residential aged care

• More Indigenous people use mainstream residential care at younger ages (60–64 years) when compared with the non-Indigenous population, with this trend reversing in older age groups.

# Chapter 1

### Introduction

### 1 Introduction

### 1.1 The Australian aged care system

The growth of the aged population in Australia has demanded formal care services that assist older people (Borowski & McDonald 2007). Australian Government-subsidised residential aged care is one of the main types of formal care delivery for frail or disabled older people administered under the *Aged Care Act 1997*. The other main types of care administered under the Act are made available in the community through packages provided under the Community Aged Care Program (CACP), the Extended Aged Care at Home (EACH) program, the Extended Aged Care at Home—Dementia (EACHD) program and the Transition Care Program (TCP). Multi-Purpose Services (MPSs) also provide residential places and community aged care. Each of these types of care is described briefly below.

Outside the *Aged Care Act 1997*, flexible places are provided under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program. Also operating outside the Act are the Australian Government-funded National Respite for Carers Program (NRCP), and the Home and Community Care (HACC) program, which is funded by the Commonwealth and state and territory governments. Under the Council of Australian Governments (COAG) National Health and Hospitals Network Agreement of 10 April 2010, the Commonwealth will mostly take full responsibility for the HACC program for people aged 65 years and over on 1 July 2011. From 1 July 2011, the Australian Government will fund the HACC Program for all clients aged 65 years and over (50 years and over for Aboriginal and Torres Strait Islander people). State and territory governments will fund the HACC Program for all people under these ages. These arrangements will not apply in Western Australia or Victoria who have not agreed to any changes to the HACC Program at this stage. In these states the HACC Program will continue to be a joint Australian Government, state and territory government initiative. The Australian Government provides 60 per cent of funding and maintains a broad strategic policy role with the remaining funding and day-to-day management provided by the state governments.

Access to assistance from any of these types of care (with the exception of HACC, NRCP and the National Aboriginal and Torres Strait Islander Flexible Aged Care Program) requires approval from a multidisciplinary Aged Care Assessment Team (ACAT) (DoHA 2009a). ACATs operate throughout Australia as a single point of entry to these aged care services, and act as a source of advice and referral about other community services. In addition, care recipients may sometimes receive assistance from more than one aged care program, for example, a CACP and residential respite care. As their care needs change, care recipients may also move from one type of care to another, such as from a CACP or EACH package to a residential aged care facility.

#### **Residential aged care**

The Australian Government funds aged care facilities to provide residential aged care to older Australians whose care needs are such that they can no longer remain in their own homes. Facilities provide suitable accommodation and related services (such as laundry, meals and cleaning) as well as personal care services (such as assistance with activities of daily living). Nursing care and equipment are provided to residents requiring such assistance. The residential aged care program is provided on a permanent or respite basis.

Prior to the *Aged Care Act 1997*, the components of residential aged care: nursing homes and hostels, were regulated and funded as separate entities. Following the *Aged Care Act 1997* these facilities were regulated under a common Act and funded according to the care needs of residents. Ageing in place was encouraged to provide better continuity of care.

#### Permanent care

Permanent residential aged care is offered to people who are no longer able to be supported living in the community. Permanent care is offered at two levels—low-care and high-care—depending on a person's assessed needs (DoHA 2009e). Assessments focus on a person's physical, medical, psychological, cultural and social needs. Permanent residents receiving low-level care require accommodation and personal care, and residents receiving high-level care require 24-hour nursing and accommodation in addition to their low-care needs.

#### **Respite care**

Residential respite gives short-term care in aged care facilities on a planned or emergency basis to elderly people who need temporary care, but intend to return to their own home. It supports elderly people in transition stages of health, and is used by carers to provide them with a break from their caring duties. Residential respite care is either planned or emergency based, and is provided as either low- or high-care.

#### Community care and flexible care

There is a continuing strong emphasis on the provision of innovative and flexible community care to help people stay in their own homes. Community care services offer packaged care at different levels of assistance, depending on the needs of the client. The largest source of community care assistance is provided through the HACC program, administered under the *Home and Community Care Act 1985*. In 2008–09, an estimated 862,488 people received assistance from the HACC program (DoHA 2010b).

Community care in a person's home is also provided as tailored packages through Community Aged Care Packages (CACP). These packages provide care for frail or disabled older people whose dependency and complex care needs would qualify them for entry to an aged care facility, at least for low-level care. CACPs are complemented by Extended Aged Care At Home (EACH) and Extended Aged Care At Home Dementia (EACHD) packages, which aim to deliver care at home that is equivalent to high-level residential care.

The Transition Care Program (TCP) is a relatively new program which is jointly funded by the Australian Government and the state and territory governments. It provides time-limited, goal-oriented and therapy-focused care for older people after a hospital stay. The TCP provides older people with a package of services that includes low-intensity therapy (such as physiotherapy), care management, nursing support and personal care. Transition care can be provided for up to 12 weeks (with a possible extension of another 6 weeks), either in a home-like residential setting or in a person's home. The places are aimed at older people who have been assessed as eligible for residential aged care during a hospital stay. This gives care recipients, their families and carers time to consider long-term care arrangements. It also aims to optimise the independence level of those older people prior to their making longer term arrangements. Because the duration of treatment is time limited, the program has a much larger reach over a year than indicated by the annual provision of places. A detailed report on the operations of the Transition Care Program for 2008–09 is now available (AIHW 2011c).

Multi-Purpose Services (MPS) are also a joint initiative between the Australian Government and those states and territories that need such services. They deliver a mix of aged care, health and community services in rural and remote communities, many of which cannot sustain separate services (DoHA 2010c). The services may be delivered at central locations or out in the community.

In addition, flexible models of care are provided under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program (NATSI Flexible Aged Care Program). The services funded under this program provide culturally appropriate residential and community aged care, mainly in rural and remote areas close to Indigenous communities.

#### Box 1.1: Aged care packages in the community

#### CACP

CACP's low-care community care places are designed to meet the daily caare needs of frail older people, allowing them to stay in their own homes and community without having to enter low-level residential care. Care planning and case management services are provided, including assistance with personal care, meals, and domestic duties, such as cleaning (DoHA 2009a).

#### **EACH and EACHD packages**

The EACH package provides care to older, frail people with more complex care needs. A customised program is developed for each individual. The aim of the EACH program is to allow older people to stay in their own homes and community instead of entering high-level residential care. EACH packages may include clinical care (nursing services), personal assistance, meal preparation, continence management, therapy services, home safety and medication management (DoHA 2009a).

The EACHD package provides high-level care for frail older people with dementia so they can remain at home. The EACHD package offers the same type of assistance as the EACH package, but is specific to the needs of people with dementia (DoHA 2009a).

### 1.2 Report structure and data sources

This is the 2009–10 edition of an annual series of reports about residential aged care in Australia. A companion report, *Aged care packages in the community: a statistical overview*, provides information about community aged care for 2009–10.

The aim of this report is to provide a summary of residential aged care provision and describe the characteristics of aged care residents. Data on expenditure relating to residential aged care is also provided.

- Chapter 2 reports on the provision of residential aged care services, including the number and distribution of
  places and the characteristics of outlets that provide these services. Some information about the provision of
  community aged care packages is provided for comparison purposes and to aid in forming an overall view of
  aged care nationally. This chapter also includes information on Extra Services and expenditure.
- Chapter 3 describes the characteristics of residents at 30 June 2010, including newly admitted residents.
- Chapter 4 contains data on patterns of service use by residents, including admitted and separated residents during 2009–10.
- Chapter 5 provides information on the Aged Care Funding Instrument (ACFI), and discusses resident care levels.
- Chapter 6 presents time series tables, providing an overview of trends over the last 10 years or more, as well as data on residents' transition from respite to permanent care.

Data on residential aged care places and aged care packages provided in the community have been extracted from the Department of Health and Ageing's (DoHA) Aged and Community Care Management Information System (ACCMIS) data warehouse. Source information is provided at relevant points for data obtained from other sources.

The first few tables in Chapter 2 (Tables 2.1 to 2.6) include places available through Multi-Purpose Services and those provided under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program. All other tables include data for mainstream services only.

# Chapter 2

### Residential aged care services and provision

# 2. Residential aged care services and provision

This chapter provides information about the number of aged care places available in Australia and where they are located. It describes the aged care approvals process, with data on approved, allocated and operational places. The chapter also includes analysis and discussion of provision ratios to determine if the current number of places in residential aged care meets the expected demands of the ageing Australian population. Some data about the provision of community aged care packages is provided for comparison purposes and to aid in forming an overall view of aged care nationally.

Information on aged care facilities is also included, as well as details of Extra Service places, expenditure and accommodation bonds.

### 2.1 Allocated places

Each year, the planning process undertaken by the Australian Government, aims to identify community needs and allocate places in a way that best meets these needs (see Box 2.1). This process aims to ensure a sufficient supply of low-care and high-care places, and achieve equitable access to services between metropolitan, regional, rural and remote areas (DoHA 2010c). Aged Care Planning Advisory Committees, which operate under the *Aged Care Act 1997*, provide advice on the distribution of places to Aged Care Planning Regions in each State and Territory. Australian Government planning of service provision aims to maintain a national target level of operational aged care places across the programs administered under the *Aged Care Act 1997* (see Section 2.4 and Box 2.3). The current target ratio is 113 places per 1,000 persons aged 70 years and over, to be achieved by June 2011 (DoHA 2010c). In addition, the planning process aims to provide access to an array of care options to meet the needs and preferences of care recipients.

#### Box 2.1: Allocation of places—the Aged Care Approvals Round (ACAR)

New aged care places are usually made available annually in each state and territory, based on the national target and provision ratio (see Box 2.3) and considering the regional distribution of need.

The ACAR is a competitive, annual application process that enables organisations to apply for a number of different Australian Government subsidised aged care places. Places are allocated to applicants who can demonstrate they best meet the needs of the ageing population within a community and an aged-care planning region (DoHA 2008).

To obtain an allocation of places under the *Aged Care Act 1997*, the applicant must be an Approved Provider. For example, organisations that wish to provide residential aged care services need to apply for the relevant Approved Provider status for the type of care they wish to provide (DoHA 2010a). Places cannot be allocated to a provider without the necessary Approved Provider status (DoHA 2008).

Places for MPSs, National Aboriginal and Torres Strait Islander Flexible Aged Care Program, and TCPs are not allocated in the ACAR process.

The approval process caters for the ongoing provision of new places that are needed to achieve the target ratio. Service providers who receive an allocation of new places are required under the *Aged Care Act 1997* to

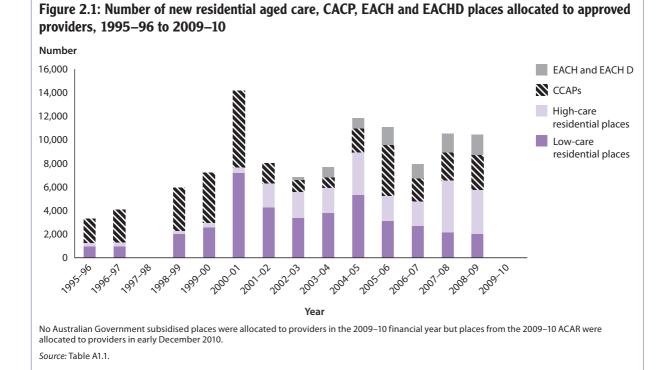

make them operational within two years, otherwise the places lapse or the provider needs to apply for an extension. As such, there are time lags from the date residential aged care, CACP, EACH and EACHD places are approved, allocated and then made operational.

The number of new aged care places allocated relates to a comparison with the national target of 113 places per 1,000 people aged 70 years and over in the general population, as well as current levels of service provision, including newly allocated places that have not yet become operational (DoHA 2010c).

In the 2008–09 ACAR, the overall allocation of new places included:

- 1,983 low-care residential places
- 3,765 high-care residential places
- 2,944 CACPs
- 1,755 EACH/EACHD packages.

Allocated high-care residential places to approved providers in 2008–09 were greater than allocated low-care places, as occurred in the 2007–08 allocations, although there were fewer allocations than in the previous year. Allocations of both high- and low-care community places (EACH/EACHD and CACP) were higher than in the previous year (Figure 2.1).

#### 2.2 Operational places

An operational place is one which is either occupied or available for the provision of aged care to an approved care recipient. The number of operational residential aged care places has increased continually since 1995, to reach almost 183,000 at 30 June 2010, a 3% increase on the previous year (Table 2.1). The increase in provision of places is intended to correspond to the future needs of an ageing population.

Residential places provided by MPSs and services funded under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program are included in the residential aged care totals in Table 2.1. At 30 June 2010 there were 129 MPSs across Australia, providing 2,707 residential care places. This was a slight increase from 30 June 2009, when there were 126 MPSs providing 2,671 places. There were 29 services funded under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program at 30 June 2010, delivering 394 residential care places, the same provision level as the previous year.

The number of operational community aged care places also increased between 2009 and 2010 (Table 2.1). CACP increased by 6% (from 40,859 to 43,300 places), EACH and EACHD combined increased by 25% (from 6,514 to 8,167 places) and TCP increased by 21% (from 2,228 to 2,698 places).

	Residential		EACH and		
Year	aged care <sup>(a)</sup>	CACP	EACHD	ТСР	Total
1995	134,810	2,542			137,352

2008	175,472	40,280	6,240	1,963	223,955
2009	178,290	40,859	6,514	2,228	227,891
2010	182,850	43,300	8,167	2,698	237,015

### Table 2.1: Number of operational residential aged care, CACP, EACH, EACHD and TCP places, 30 June1995 to 30 June 2010

(a) From 1999 the data in this table include places provided by MPSs, and those funded under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program. Non-residential flexible care packages are counted under CACP.

.. Not applicable.

### 2.3 How are places distributed nationally?

#### Distribution of population aged 70 years and over across Australia

The provision of places for residential aged care is targeted to people aged 70 years and over. Consequently, knowing the geographic areas where older people reside is important. Through the planning and allocation processes the Australian Government aims to distribute aged care services in an equitable way according to this criterion.

At 30 June 2010, there were 2.1 million Australians aged 70 years and over. The majority of people of this age lived in *Major cities* (66%), with most of the remainder living in *Inner regional* (23%) and *Outer regional* (10%) areas (see Box 2.2). Only 1% resided in *Remote* areas and 0.3% in *Very remote* areas (Table 2.2).

#### Box 2.2: How is remoteness defined?

The term 'remoteness', as used in this publication, refers to a classification defined by the Australian Standard Geographical Classification (ASGC) (ABS 2010b). The ASGC uses measures of access and distance to services offered in urban areas to determine classifications of Australian remoteness. These classifications are:

- Major cities
- Inner regional
- Outer regional
- Remote
- Very remote

Tasmania has no areas classified as *Major cities*, as Hobart is classified as *Inner regional*. Similarly, the Australian Capital Territory has no areas classified as *Outer regional*, *Remote*, or *Very remote* areas. In addition, *Remote* and *Very remote* areas, and states and territories such as the Northern Territory and the Australian Capital Territory, have low population numbers. Therefore, comparisons of proportions and interpretation of data between these and other, more highly populated, locations must be undertaken with caution.

Table 2.2: Distribution of population aged 70 years and over by state/territory and remoteness, 30 June 2010

.. Not applicable.

ş

Note: The remoteness classification used in this report is based on the ASGC Remoteness Structure developed by the Australian Bureau of Statistics (ABS) (ABS 2010b). This categorises all Census Collection Districts (CDs) in Australia according to their remoteness, based on physical road distance to the nearest urban centre. Remoteness is measured by the Accessibility/Remoteness Index of Australia (ARIA) (ABS 2010b).

Source: SCRGSP 2011, Table 13A.2.

#### **Distribution of places**

The distribution of total aged care places among the states and territories and across remoteness areas broadly reflects the distribution of the target population (tables 2.3 and 2.4). Around one-third of places are located in New South Wales, with a further quarter in Victoria (Table 2.3). Less than 1% of places are located in the Northern Territory. In terms of remoteness, around two-thirds of places are in *Major cities* with most of the remainder located in *Inner regional* or *Outer regional* areas (Table 2.4). Very few EACH places and no EACHD or TCP places are located in *Very remote* areas, reflecting the difficulty in delivering specialised services in these locations.

State/ territory	Residential	САСР	EACH	EACHD	ТСР	Total places (Number)	Total places (Per cent)
NSW	62,740	14,294	1,723	792	934	80,483	34.0

#### Table 2.4: Residential aged care, CACP, EACH, EACHD and TCP places, by remoteness<sup>(a)</sup>,30 June 2010

(a) Refers to the location of the services. The table uses the ASGC Remoteness Structure as developed by the ABS.

Note: These figures include places provided by MPS, and places funded under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program for residential aged care and community aged care packages.

Further information on the provision of CACP, EACH and EACHD for 2009–10, and TCP for 2008–09, is published in two separate reports in this series (AIHW 2011a,c). Detailed information about CACP and EACH recipients and the type of assistance they receive was collected in 2002 through the Community Aged Care Packages Census (AIHW 2004). An updated Community Care Census was conducted early in 2008, and the results have been published by the Department of Health and Ageing (DoHA 2010d).

### 2.4 Aged care provision ratios

As described in Section 2.1, a planning and allocation process is undertaken annually to determine the geographic distribution and types of aged care places to be made available. The process aims to maintain a national target level of operational places across the programs administered under the *Aged Care Act 1997*. The current national target ratio for aged care provision is 113 aged care places per 1,000 persons aged 70 years and over, consisting of 88 residential aged care places and 25 community care places, to be achieved by June 2011. This target ratio does not include TCP places (see Box 2.3).

#### Box 2.3: National target ratio and provision ratio

#### What is the Australian Government target ratio?

In 2007, the target ratio was lifted from 108 to 113 places per 1,000 persons aged 70 years and over. This target was expected to be achieved by 30 June 2011.

Of those 113 places:

- 88 are for residential aged care
  - 44 for high-care places
  - 44 for low-care places
- 25 are for community care places
  - 4 for high-care (EACH and EACHD)
  - 21 for low-care (CACPs).

#### What does the provision ratio measure?

The provision ratio compares the amount of *places available* to a specific population at a point in time, usually a 30 June date. Currently, aged care planning calculates the number of places available per 1,000 people aged 70 years and over. Under these circumstances, if a provision ratio is 10, it would mean that there are 10 places available for every 1,000 people 70 years and over. In 2010, the target for high-level community care was increased from 4 to 5 places, while the target for high-level residential care was temporarily adjusted to 43 places per thousand people aged 70 or over. This was to ensure that the overall target ratio is achieved in 2011, together with the balance of 48 high-care and 65 low-care places.

#### National provision ratios in 2010

The provision ratio for residential places was 86.8. This figure is slightly down compared to the previous year because of growth in the population aged 70 years and over, and limited capacity of providers to develop new places in the designated areas of need.

The overall provision ratio at 30 June 2010 was 111.2 per 1,000 persons aged 70 years and over (Table 2.5). Provision ratios are calculated for residential aged care, CACP, and EACH and EACHD combined, and take

account of places provided through MPS and places funded under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program. The overall totals are also reported.

Provision ratios for community care at 30 June 2010 were close to the national targets, at 20.5 for CACP (low-care) and 3.9 for EACH and EACHD combined (high-care). More detailed information about the provision of community care places is published in *Aged care packages in the community 2009–10: a statistical overview* (AIHW 2011a).

Year	Residential	САСР	EACH and EACHD	Total <sup>(a)</sup>
1995	92.2	1.7		93.9
1996	90.6	2.9		93.5
1997	89.2	3.9		93.1
1998	87.1	6.3		93.3
1999	85.6	8.4		94.0
2000	83.6	10.8		94.4
2001	82.2	14.0		96.2
2002	81.9	14.8		96.7
2003	83.3	15.4	0.1	98.8
2004	85.0	15.8	0.5	101.2
2005	86.3	16.5	0.9	103.7
2006	87.0	18.5	1.7	107.2
2007	86.9	19.4	2.3	108.6
2008	87.7	20.1	3.1	110.9
2009	87.0	19.9	3.2	110.1
2010	86.8	20.5	3.9	111.2

Table 2.5: Aged care places per 1,000 persons aged 70 years and over, 30 June 1995 to 30 June 2010

(a) The ratios are based on ABS population estimates released in December 2010 (ABS 2010a).

Total provision may vary from the sum of the component parts because of rounding.

.. Not applicable.

Note: These figures include places provided by MPS and places funded under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program.

#### Geographic variation in provision ratios

There is some variation in provision ratios among the states and territories (Table 2.6). South Australia had the highest residential aged care provision ratio (92.4 places per 1,000 persons aged 70 years and over), followed by the Northern Territory (91.2). The lowest provision ratios for residential aged care were in the Australian Capital Territory (80.4) and Western Australia (81.0).

The combined ratio of all aged care places per 1,000 people aged 70 years and over was much higher in the Northern Territory than in any of the other jurisdictions. This partly relates to the provision of community care places in remote communities. Combined provision ratios in the other jurisdictions were close to the national average of 112.5.

Greater variation in provision ratios is apparent across remoteness areas nationally and among the states and territories (Table A1.9). For example, at the national level the residential care ratio varied from 77.5 in *Outer regional* areas to 103.7 in *Very remote* areas, but the ratio in *Very remote* areas varied from 30.0 in New South Wales to 166.7 in South Australia. Again, some of this variation is accounted for by the need for providing other services in remote communities in some states and territories.

#### Access for Aboriginal and Torres Strait Islander people

Health conditions related to ageing often affect Aboriginal and Torres Strait Islander people earlier than other Australians. Therefore, Indigenous Australians often access aged care programs at a younger age compared to non-Indigenous Australians. As mentioned previously, the provision ratio is based on a comparison of the number of places available to the number of Australians aged 70 years and over. However, due to their increased need at younger age levels, planning for aged care services also includes consideration of the Indigenous population aged 50–69 years.

The Northern Territory has a much higher proportion of Aboriginal and Torres Strait Islander people than other states or territories: 39% of all residents in care compared with 2% in Western Australia and less than 1% in the other jurisdictions. If the calculation of provision ratios includes Indigenous Australians aged 50–69 years, then the residential care provision ratio in the Northern Territory falls from 91.2 to 44.3, and the national ratio falls from 86.8 to 84.3 (Table 2.6). Similarly, the combined ratio in the Northern Territory reduces from 220.0 to 106.8, and the ratio for Australia reduces from 112.5 to 109.3. This effect is taken into account in Australian Government planning for adequate service provision.

	Residenti	al places	Combined places <sup>(a)</sup>		
State/territory	Total (70+ years)	Total (70+ and Indigenous population aged 50–69 years)	Total (70+ years)	Total (70+ and Indigenous population aged 50–69 years)

NT	91.2	44.3	220.0	106.8	
Australia	86.8	84.3	112.5	109.3	

#### Table 2.6: Aged care places per 1,000 persons, by state/territory, 30 June 2010

(a) Comprises residential aged care, CACP, EACH, EACHD and Transition Care places.

Notes

1. These figures include places provided by MPS and places funded under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program.

2. The Aboriginal and Torres Strait Islander population aged 50–69 years uses ABS projections (ABS 2009).

### 2.5 Residential aged care facilities

Data presented in this section and all further sections exclude places provided by MPS and places provided under the National Aboriginal and Torres Strait Islander Flexible Aged Care Program. There were 3,101 such places at 30 June 2010.

#### Number of facilities

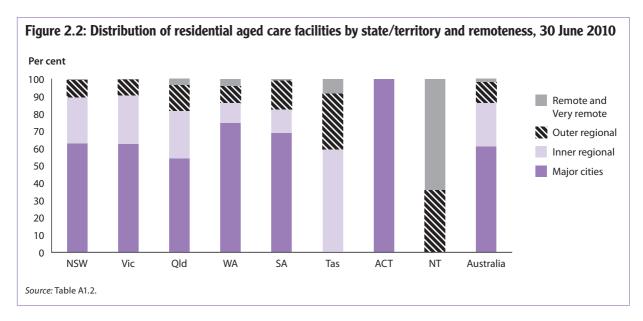

At 30 June 2010 there were 2,772 facilities providing residential aged care places. This was a decrease of 10 facilities from the previous year (2,783 facilities).

#### Location of facilities

The location of residential aged care facilities across Australia is designed to match the population distribution of people aged 70 years and over (Figure 2.2).

Most facilities were located in *Major cities* (61%), a quarter of facilities (25%) were located in *Inner regional* areas and 12% of facilities were located in *Outer regional* areas. *Remote* and *Very remote* areas had a small number of facilities (2% in total).

Under the Australian Standard Geographical Classification for remoteness (ABS 2010b), Hobart and Darwin are classified as *Inner regional* and *Outer regional* areas, respectively. Tasmania thus had the majority of its facilities in *Inner regional* areas (59%). In contrast, the Northern Territory had more facilities in *Remote* and *Very Remote* areas (64%) than in *Outer regional* areas (36%) (Figure 2.2).

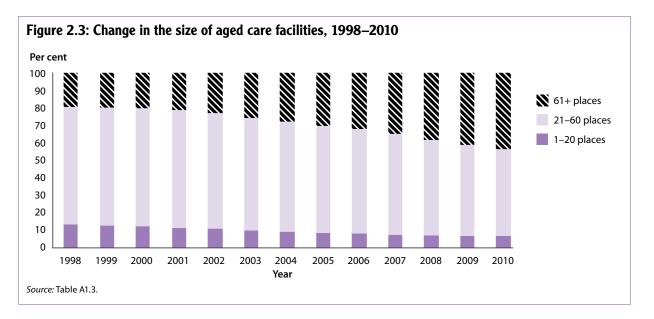

#### Number of places per facility

Compared with the previous year, there were an increased number of operational residential care places at 30 June 2010 (179,749 compared with 175,225 at 30 June 2009). Combined with the reduced number of facilities, this resulted in a higher number of places on average per facility compared with 2009.

15

This continues a trend resulting from a noticeable change in service structure over the last decade. At 30 June 2005 there were 2,929 facilities providing residential aged care, reducing steadily to 2,772 at 30 June 2010 (Table A1.3). The amalgamation of services and the need to achieve economies of scale help to explain this trend.

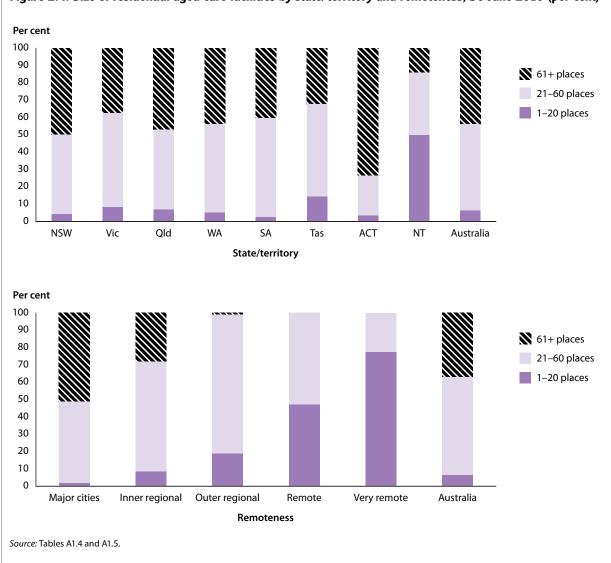

In 2005, 9% of services (258 facilities) had between 1 and 20 places. This had reduced to 7% (189 facilities) by 2010. The proportion of facilities with more than 60 places increased from 26% (763) in 2005 to 34% (940) in 2010 (Figure 2.3).

#### Geographic variation in size of facilities

The distribution of facility sizes among the states and territories varied most widely between the smaller jurisdictions (Figure 2.4). Two-thirds of facilities in the Australian Capital Territory had more than 60 places, compared with one-fifth of facilities in Tasmania and around 1 in 7 facilities in the Northern Territory. The Northern Territory had the greatest proportion of small facilities, with half of all facilities in that territory having 20 places or less.

As could be expected, large aged care facilities were more common in *Major cities*, with 42% having more than 60 places (Figure 2.4). However, in the *Remote* areas almost all aged care facilities had 40 places or less (86%). There were no aged care facilities with over 60 places in *Very remote* areas.

#### Figure 2.4: Size of residential aged care facilities by state/territory and remoteness, 30 June 2010 (per cent)

#### Who provides residential aged care services?

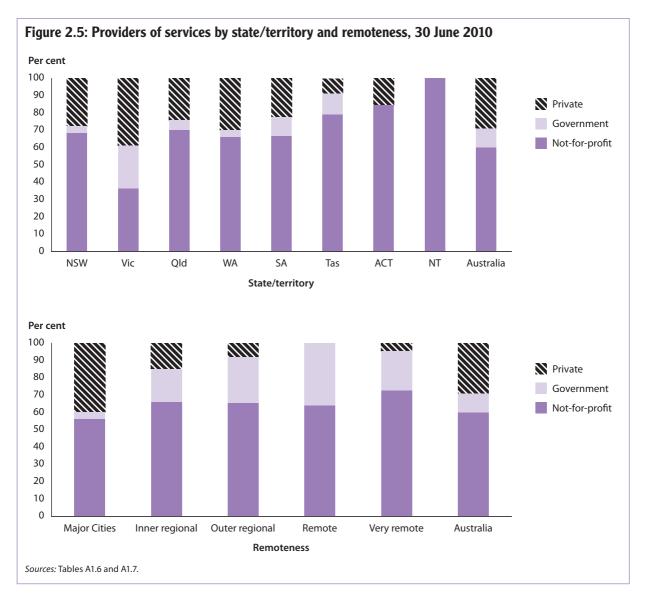

Residential aged care services in Australia are delivered by providers across a range of sectors. These include private, government (local and state government), and not-for-profit (comprising religious, community-based, and charitable) providers.

Not-for-profit and private organisations were the main providers of residential aged care services nationally, with 60% and 29% of facilities, respectively (Figure 2.5). However, the distribution varied markedly among the states and territories. Private ownership of facilities was highest in Victoria (39%); this state also had the lowest proportion of not–for-profit facilities (36%) and the highest proportion of government-owned facilities (25%).

Not-for-profit services dominated in the smaller jurisdictions, accounting for 79% of facilities in Tasmania, 85% in the Australian Capital Territory and all facilities in the Northern Territory. Religious organisations were the most common not-for-profit owners in all jurisdictions except Victoria (Table A1.6).

Ownership of services also varied across remoteness areas, with the main difference being the split between private and government ownership (Figure 2.5). Only 1 facility in *Very remote* areas and no facilities in *Remote* 

areas were privately owned, compared with 40% of facilities in *Major cities*. By contrast, only 4% of services in *Major cities* were government-owned compared with 36% in *Remote* areas and 23% in *Very remote* areas. *Very remote* areas had the highest proportion of services provided by not-for-profit organisations (73%).

### 2.6 Extra Service places

Extra Service is designed to include a higher standard of accommodation, services and food for residents in aged care (DoHA 2010c). These options include higher quality personal accommodation and furnishings, a greater choice of recreational and communal space, and a wider range of food and meal options (DoHA 2009d).

Extra Service does not involve the provision of a higher level of care to meet a resident's assessed care needs Aged care facilities are only approved to offer Extra Service if the quality of these extras is significantly higher than average.

Up to 15% of places in each state or territory may be approved as Extra Service (DoHA 2004). Extra Service attracts a reduced residential care subsidy from the Australian Government, and residents may also be charged an accommodation bond for both high-care and low-care places.

A total of 315 residential aged care facilities (11%) provided Extra Service places at 30 June 2010. (Table 2.7).

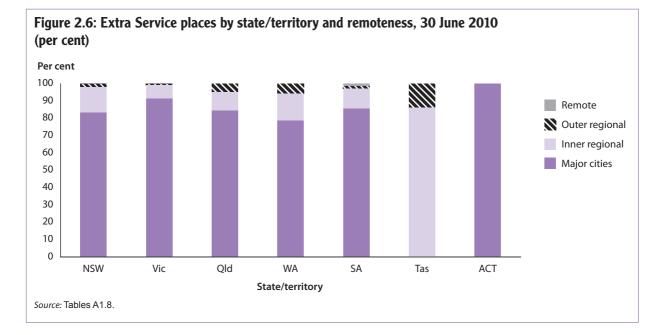

#### Table 2.7: Number of facilities with Extra Service places, 30 June 2010

Residential care facilities	Number
All residential care facilities	2,772
Facilities providing Extra Service places	315

Facilities with Extra Service status were concentrated in *Major cities* (84%) and *Inner regional* areas (13%). There were no Extra Service-approved facilities in the Northern Territory, or in *Remote* areas outside of South Australia.

Approved facilities offered 13,551 Extra Service places across Australia, accounting for 8% of all operational places in mainstream services. Most of these (12,162 or 90%) were high-care places. Around one-third of all Extra Service places (31%) were located in Victoria and a further third (31%) in New South Wales (Table A1.8).

A small proportion of Extra Services places were located in Inner and *Outer regional* areas (13% and 3% respectively). Tasmania and Western Australia had the highest proportions of their extra service places in *Outer regional* areas (14% and 6%, respectively) (Figure 2.6).

### 2.7 Spending on residential aged care

#### Australian Government expenditure

Aged care services expenditure continues to be a significant area of government spending. In 2009–10, the total Australian, state and territory government expenditure on aged care services was around \$11.0 billion. The majority of all government expenditure on aged care services is spent on residential aged care services (66%) (SCRGSP 2011).

Most government expenditure on residential aged care services in 2009–10 was accounted for by the Australian Government Department of Health and Ageing (83% of the total). The Australian Government Department of Veteran's Affairs provided a further 15% of the total, with state and territory governments providing the remainder (SCRGSP 2011).

Expenditure data in this section are broad estimations of expenditure relating to residential aged care services. Small discrepancies between the figures provided here and those published in the *Report on government services 2010* (SCRGSP 2011) are due to differences in the date the ACCMIS data warehouse was accessed.

Australian Government recurrent expenditure on residential aged care services was estimated to be \$7.1 billion in 2009–10 (Table 2.8). This does not include any funding or subsidies paid by state or territory governments.

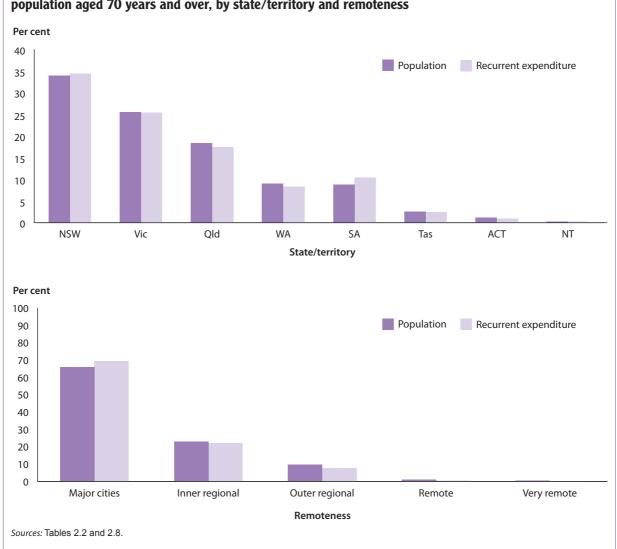

More than two-thirds of all recurrent expenditure on residential aged care (69%) was spent in *Major cities* (\$4.9 billion). Expenditure in *Very remote* areas was just over \$14.0 million (0.2% of the total). In terms of the 70 plus population distribution the proportion of funding for *Major cities* is higher than corresponding proportion of the population aged 70 plus and funding to *Outer regional* and *Remote* is lower than corresponding proportion of the population aged 70 plus (tables 2.2 and 2.8 and Figure 2.7).

State/ territory	Major cities	Inner regional	Outer regional	Remote	Very remote	Australia
NSW	1,725.6	574.6	139.3	3.7		2,443.1
Vic	1,318.8	396.3	89.6	1.9	0.0	1,806.6

### Table 2.8: Estimated recurrent Australian Government expenditure on residential aged care, by state/ territory and remoteness area<sup>(a)</sup>, 2009–10 (\$ million)

(a) Refers to the location of the services. The table uses the ASGC Remoteness Structure developed by the ABS.

The distribution of expenditure across the states and territories and remoteness areas was broadly in line with the distribution of target population (those aged 70 years and over) (Figure 2.7).

### Figure 2.7: Distribution of recurrent expenditure on residential aged care 2009–10, and distribution of population aged 70 years and over, by state/territory and remoteness

#### Recurrent expenditure per person aged 70 years and over

Australian Government recurrent expenditure on residential aged care per person aged 70 years or over in 2009–10 was highest in South Australia (\$3,988) and lowest in the Australian Capital Territory (\$2,749) (Table 2.9). This varied more widely across remoteness areas both nationally and within and between jurisdictions. For example, estimated expenditure per person in *Remote* New South Wales was around \$1,200, compared with over \$5,000 in *Remote* Northern Territory. Some of this variation may be the result of expenditure on services for Indigenous Australians aged 50–69 years.

State/ territory	Major cities	Inner regional	Outer regional	Remote	Very remote	Australia
NSW	3,572	3,304	2,448	1,156	0	3,406

(a) Refers to the location of the services. The table uses the ASGC Remoteness Structure as developed by the ABS.

.. Not applicable.

#### Recurrent expenditure per occupied place-day

The estimated Australian Government expenditure was \$118 per occupied place-day during 2009–10 (Table 2.10). This level varied somewhat among the jurisdictions and across remoteness areas, peaking at \$163 in *Very remote* Northern Territory.

Table 2.10: Australian Government recurrent expenditure per occupied place-day, by state/territory and

Sources: Tables 2.8 and 4.10.

#### Accommodation bonds

The Australian Government provided around 70% of the funding for residential aged care in 2009–10 (DoHA 2010c). Co-contributions from residents for care payments and accommodation costs were the main additional structured source for cash flows to cover operating costs. Additional support for the sector comes in via bequests and voluntary work and from local, state and territory governments and other places. In particular, approved providers make a de facto contribution in years where they run an operating loss in facilities.

Accommodation bonds (see Box 2.4) are an additional source of income for aged care facilities. These funds are used to improve the facilities available to residents.

#### **Box 2.4: Accommodation bonds**

#### What is an accommodation bond?

An accommodation bond is a payment permanent residents may be asked to pay when they enter lowlevel residential care, or are admitted to an Extra Service place (with low- or high-care status) (DoHA 2011). If residents cannot afford to pay an accommodation bond, then they are not asked to pay (DoHA 2010c).

#### How much bond does a resident pay?

There is no fixed bond amount to pay. The bond amount is negotiated between an approved provider and a resident (DoHA 2009e). The maximum bond a resident can be asked to pay depends on the level of a resident's assets when they entered the facility as a permanent resident (DoHA 2010c). Residents have the option of paying an accommodation bond as a lump sum, a regular periodic payment, or a combination of both (DoHA 2009e).

#### What is the accommodation bond used for?

The residential aged care facility is able to deduct monthly amounts, called retention amounts, from the bond for up to five years (DoHA 2011). There is a maximum retention amount, and the balance of the bond is refunded to the resident when they leave the home. Providers must use the income from accommodation bonds and retention amounts to undertake capital works and improve the quality and range of aged care services (DoHA 2010c). Providers can also keep any interest earned from accommodation bonds (DoHA 2009e).

#### Bond payments received from contributing residents

Between 1 July 2009 and 30 June 2010, aged care providers received over \$4.5 billion in accommodation bonds from around 16,900 permanent residents admitted during this period (30% of all newly admitted residents) (Tables 2.11 and 2.12). Of these, just under 71% were female. The average bond was around \$264,300.

Just over one-third of permanent residents who paid a bond were aged 85–89 years (35%), and each paid an average of around \$267,600. The next largest group of bond contributors were those aged 80–84 years (24%); their average bond was just under \$267,500.

Residents contributing to bonds in *Major cities* paid a higher amount on average than those in other areas. Contributing residents in *Remote* areas paid the lowest amount on average at around \$127,000 (Table 2.13).

State/ territory	Major cities	Inner regional	Outer regional	Remote	Very remote	Australia
NSW	1,196.0	282.9	49.7	0.7	0.0	1,529.2

# Chapter 3

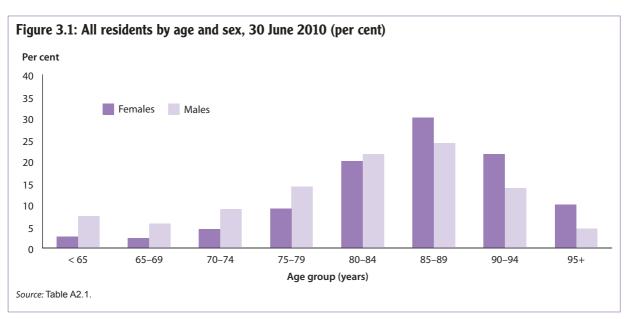

### **Resident characteristics**

### 3 Resident characteristics

This chapter describes the demographic characteristics of permanent and respite residents as at 30 June 2010. Information on residents' pension status and financial support status is also included. In addition, some data are presented about hospital leave taken during the year to 30 June 2010 and characteristics of residents newly admitted in 2009–10.

At 30 June 2010, there were 166,370 residents in mainstream residential aged care services. This was an increase of 2.5% over the previous year. Just under 162,600 residents were in permanent care (98%), and 3,373 were in respite care (2%). Note that the 30 June figures under-represent the importance of respite care, due to the short-term nature of this type of care. The total number of people accessing residential respite care over a year will be much greater than this amount.

### 3.1 Age and sex

Seventy per cent of residents on 30 June 2010 were female (Table A2.1). Of all female residents, 62% were aged 85 years and over, compared with 42% of their male counterparts. This can be attributed to the greater proportion of females among older age groups in the general population.

The largest 5 year age grouping of residents were those aged 85–89 years, accounting for 28% of the total (Figure 3.1). Four per cent of residents were under 65 years of age. Male residents generally had a younger age profile than female residents.

Fifty-six per cent of permanent residents were aged 85 years and over. This proportion has gradually increased since 2000, when 50% of residents were in this age group (see Table 6.1). Respite residents at 30 June 2010 had a younger age profile than permanent residents, with less than half (47%) being aged 85 years and over (Table A2.1).

### 3.2 Geographical location

#### State and territory

The distribution of residents across the states and territories closely reflected the distribution of the population aged 70 years and over (see Table 2.2), with just over one-third of residents being in New South Wales and around 0.3% in the Northern Territory.

The age-sex distribution of residents was similar across most jurisdictions, however the Northern Territory had a noticeably younger age profile, with 14% of residents aged under 65 years—more than three times higher than the national average of 4% (Table A2.2). Consequently, there was a lower proportion of older residents in the Northern Territory compared with the national average: 30% compared with 56% aged 85 years and over, and 11% compared with 28% aged 90 years and over.

#### Remoteness

The distribution of residents among remoteness areas was also similar to the distribution of the population aged 70 years and over (see Table 2.2). Over two-thirds of residents were in *Major cities* whereas just 0.2% were in *Very remote* areas.

Residents using services in *Remote* and *Very remote* areas had a younger age profile than residents living in other areas (Table A2.3). Ten per cent of residents in *Remote* areas and 20% of those in *Very remote* areas were aged under 65 years, compared with around 4% of those in the other areas.

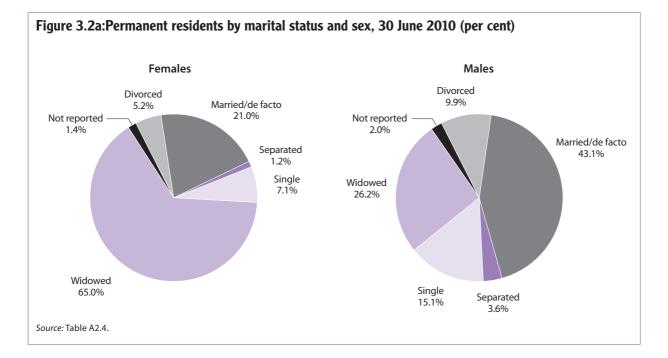

### 3.3 Marital status

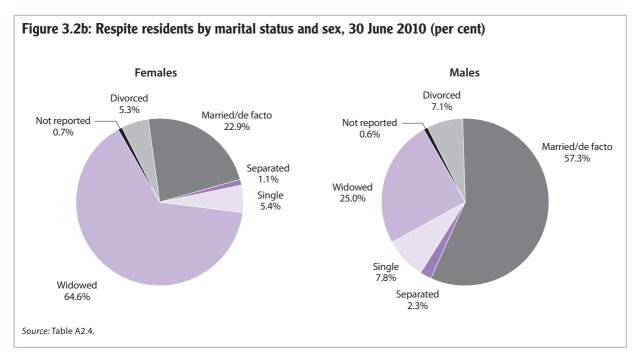

Almost all residents at 30 June 2010 had their marital status recorded at admission. Two-thirds (65%) of permanent female residents reported being widowed compared with just over a quarter (26%) of their male counterparts. Given that married females often outlive their male spouses, they are more likely to lack support at home as they age, and may then need to be admitted to residential aged care. A smaller proportion of female permanent residents were married or in a de facto relationship (20%) compared with their male counterparts (43%) (Figure 3.2a).

Similarly, among respite residents a much higher proportion of females were widowed—almost two-thirds, compared with one-quarter of males (Figure 3.2b).

The distribution of marital status among females was similar for permanent and respite residents, but for males there was some variation. Male permanent residents were almost twice as likely as male respite residents to be single (15% compared with 8%) and were substantially less likely to be married or in a de facto relationship (43% compared with 57%).

The distribution of marital status was similar across most of the states and territories, however the Northern Territory had lower proportions of permanent and respite residents who were in a married or de facto relationship (18% and 23%, respectively) compared with the national averages (27% and 36%, respectively) (Tables A2.5 and A2.6). Higher proportions of residents in the Northern Territory were single or separated compared with the other jurisdictions.

## 3.4 Indigenous status

Of the 162,597 permanent aged care residents at 30 June 2010, 0.7% (1,071 residents) identified as Aboriginal and/or Torres Strait Islander (Table 3.1). A slightly higher proportion of respite residents (1.3%) at 30 June 2010 identified as Aboriginal and/or Torres Strait Islander. Male residents were slightly more likely than female residents to identify as Indigenous.

The Northern Territory had the highest proportion of Aboriginal and Torres Strait Islander people among its permanent residents (37%). Among respite residents, 58% of those in the Northern Territory identified as Indigenous, compared with the national average of 1.3% (Tables A2.7 and A2.8). However, the number of respite residents in the Northern Territory at 30 June 2010 was considerably lower than in most other jurisdictions, so this comparison should be made with caution.

The highest numbers of Indigenous permanent residents were in Queensland (275 persons) and Western Australia (269 persons).

	Permanen	t	Respite						
 Indigenous status	Number	Per cent	Number	Per cent					
		Females

#### Table 3.1: Permanent and respite residents by Indigenous status and sex, 30 June 2010

## 3.5 Country of birth

Country of birth was recorded for almost all residents in residential aged care at 30 June 2010. Over a quarter (28%) of permanent residents and 30% of respite residents reported being born overseas (Table 3.2). The most common overseas place of birth for permanent and respite residents was the United Kingdom or Ireland. Western Australia had the greatest proportion of residents born overseas, with residents in this state being almost twice as likely to be from the United Kingdom or Ireland as the national average.

Among residents born outside of the main English-speaking countries, the most common region of birth was South Eastern and Eastern Europe. Victoria and the Australian Capital Territory had the greatest proportions of respite residents from this region.

#### Table 3.2 (continued): Permanent and respite residents, birthplace<sup>(a)</sup> by state/territory, 30 June 2010 (per cent)

(a) This table uses Australian standard classification of countries (ABS 2008).

## 3.6 Preferred languages

Preferred language was also recorded for almost all residents at admission. English was the preferred language for the majority of residents in aged care at 30 June 2010 (90% for permanent, 89% for respite) (Table 3.3). Corresponding to the countries of birth, the most common other preferred languages were those from Southern and Eastern Europe. Australian Indigenous languages were preferred by a substantial proportion of residents in the Northern Territory (25% of permanent residents and 42% of respite residents).

Table 3.3: Permanent and respite residents, preferred language<sup>(a)</sup> by state/territory, 30 June 2010 (per cent)

(a) This table uses Australian standard classification of languages (ABS 2005–06).

### 3.7 Income source

A large proportion of permanent residents at 30 June 2010 (89%) received a government pension, either from Centrelink (71%) or the Australian Government Department of Veterans' Affairs (DVA) pension (18%)(Figure 3.3). There was little difference between the proportion of males and females receiving pensions (Table A2.9).

Self-funded retirees comprised just under 9% of permanent residents (9% of females and 8% of males) (Table A2.9). The Australian Capital Territory had a much higher proportion of self-funded retirees (21%) compared with other states and territories. The Northern Territory was the jurisdiction with the greatest proportion of permanent residents receiving a Centrelink pension (88%) but the smallest proportion receiving a DVA pension (6%), meaning that the proportion of pensioners overall was similar to that in most other jurisdictions.

## **3.8 Support for financially disadvantaged residents**

There is an obligation under the *Aged Care Act 1997* to ensure that financially disadvantaged people have equitable access to residential aged care.

Income and asset rules determine eligibility for special conditions to apply for limits on daily care fees, accommodation charges and accommodation bonds.

Since 1 October 1997, the conditions around eligibility have changed. Appendix 6 provides a detailed description of the different conditions and terminology used for residents receiving financial help across three different time periods. The tables below describe 'Residents receiving financial help', which includes concessional, assisted, supported and partially supported residents. Appendix tables A2.10 and A2.11 provide a detailed breakdown of concessional, assisted, and supported residents.

Nationally, just under one-third (31%) of permanent residents at 30 June 2010 received financial help (after removing the 'pre-reform' group, see Appendix 6) (Table 3.4). The proportion of permanent residents receiving financial help was greatest in the Northern Territory (54%) and lowest in the Australian Capital Territory (24%). All other jurisdictions had around 30% of permanent residents receiving financial help.

Financial support status	NSW	Vic	Qld	WA	SA	Tas	ACT	NT	Australia
					Numbe	r			
Residents receiving financial help	16,689	11,864	9,260	4,442	4,881	1,300	414	209	49,059
Residents not receiving financial help	37,383	29,358	19,335	8,912	10,227	2,811	1,317	179	109,522
Total persons	54,072	41,222	28,595	13,354	15,108	4,111	1,731	388	158,581
					Per cen	t			
Residents receiving financial help	30.9	28.8	32.4	33.3	32.3	31.6	23.9	53.9	30.9
Residents not receiving financial help	69.1	71.2	67.6	66.7	67.7	68.4	76.1	46.1	69.1
Total persons	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

#### Table 3.4: Financial support status of permanent residents at 30 June 2010, by state and territory<sup>(a)</sup>

(a) Refers to the location of the services.

*Note*: There were 4,016 pre-reform admissions in current clients. The numbers above are calculated by first subtracting pre-reform numbers from total permanent persons in care. Secondly, all 'Residents receiving financial help' refers to the sum of concessional, assisted, supported and partially supported residents, and 'Residents not receiving financial help' refers to the sum of residents not eligible for support and unsupported residents.

Financial support for residents became more likely with increasing remoteness (Table 3.5). Over 60% of permanent residents in *Very remote* areas at 30 June 2010 received financial help compared with 30% of those in *Major cities*.

#### Table 3.5: Financial support status of permanent residents at 30 June 2010, by remoteness<sup>(a)</sup>

Financial support status	Major cities	Inner regional	Outer regional	Remote	Very remote	Australia
			Numl	per

## 3.9 Hospital leave

Hospital leave enables a permanent aged care resident to take leave to receive hospital treatment.

Overall, of the approximately 162,600 permanent residents in care at 30 June 2010 almost one-quarter of these residents had used hospital leave in the preceding 12 months (Table 3.6). Hospital leave was most likely among residents in *Major cities* (26%) and least likely among those in *Very remote* areas (19%).

## 3.10 Newly admitted residents

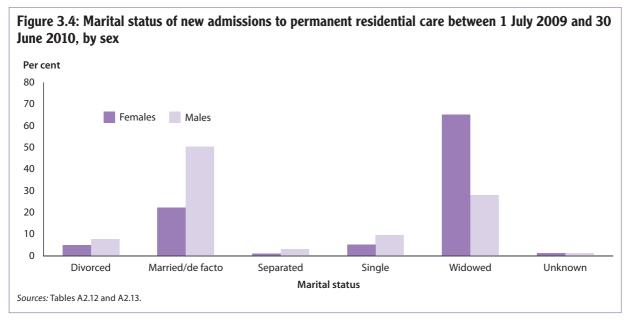

Data in this section relate to an individual's last admission during the year, and so are equivalent to the number of newly admitted individuals. By comparison, data presented in Section 4.1 relate to all admissions, and individuals may be counted more than once.

Between 1 July 2009 and 30 June 2010 there were almost 57,000 persons admitted to permanent residential care and more than 41,000 admitted to respite care (Tables A2.12 and A2.13). An individual may be 'admitted' more than once if he or she leaves care for a specified period of time. Around three-quarters of newly admitted permanent and respite residents were aged 80 years and over (74% and 71%, respectively). The proportion of older residents has been increasing over the past decade (see Section 6.2).

#### Marital status of new residents

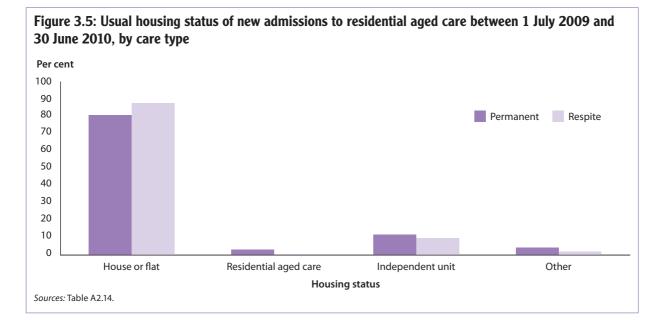

Half of permanent and respite residents (51% and 50%, respectively) admitted between 1 July 2009 and 30 June 2010 were widowed. A slightly higher percentage of newly admitted respite residents (38%) were married or in de facto relationships compared to permanent residents (33%) (Tables A2.12 and A2.13).

The majority (65%) of new permanent female residents were widowed, and approximately a quarter were married or in a de facto relationship (22%) (Figure 3.4). By contrast, around one-quarter of permanent male residents were widowed (28%), with the majority being married or in a de facto relationship (51%).

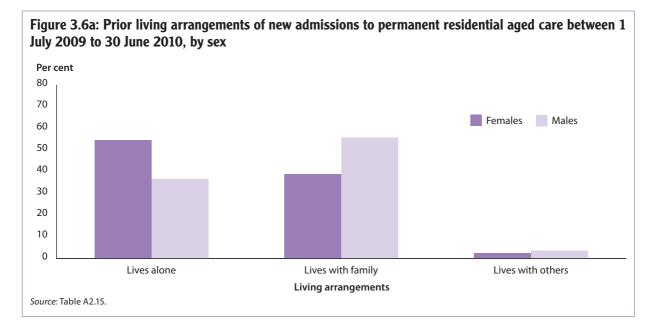

The majority of newly admitted residents from 1 July 2009 to 30 June 2010 had been living in a house or flat before admission (81% of permanent residents and 88% of respite residents) (Figure 3.5). Around 1 in 10 had been living in an independent unit (that is, a self-care, individual residence situated within a retirement village or aged care facility).

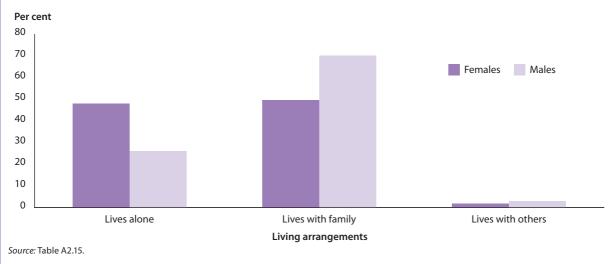

#### **Prior living arrangements**

Almost half of residents newly admitted to permanent care between 1 July 2009 and 30 June 2010 had lived alone prior to admission (Figure 3.6a). Most of the remainder had lived with family. Females were more likely than males to have lived alone prior to their admission.

Over half of new respite residents between 1 July 2009 and 30 June 2010 had lived with family prior to their admission (Figure 3.6b). This was much more common among males than females (70% compared with 50%).

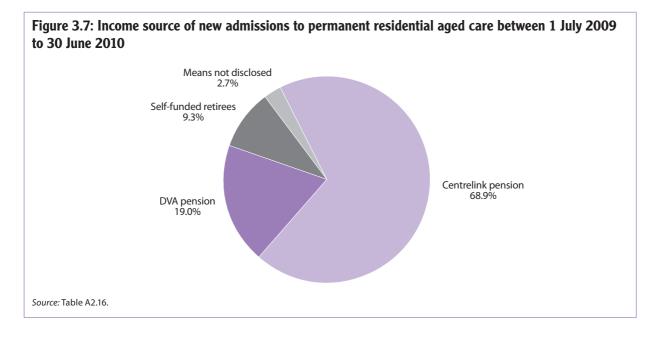

The majority (88%) of residents newly admitted to permanent care between 1 July 2009 and 30 June 2010 were receiving a government pension (Figure 3.7). Self- funded retirees accounted for 9% of new admissions. The distribution of income sources was similar for males and females (Table A2.16).

# Chapter 4

## Patterns of use

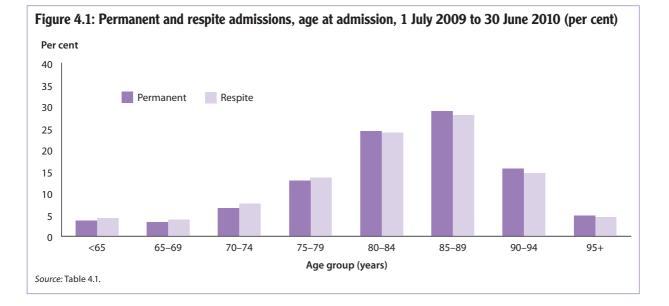

# 4 Patterns of use

This chapter explores a number of areas relating to residential aged care use, including admissions, separations and length of stay, usage rates, turnover, occupied place-days, and average occupancy between 1 July 2009 and 30 June 2010.

## 4.1 Admissions

Between 1 July 2009 and 30 June 2010 there were 115,440 admissions to residential aged care: almost 58,000 for permanent care and 57,500 for respite care (Table 4.1). The majority (72%) of residents admitted to care in 2009–10 were aged 80 years and over. The most common age group was 85–89 years, accounting for 29% of permanent admissions and 28% of respite admissions (Figure 4.1).

The Northern Territory had a greater proportion of younger residents admitted to residential care compared with the other jurisdictions; 12% of permanent and 20% of respite residents admitted in the Northern Territory were aged less than 65 years, compared with around 4% of residents in the other states and territory (Tables A3.1 and A3.2).

#### Table 4.1: Permanent, respite and all admissions, age at admission by sex, 1 July 2009 to 30 June 2010

Note: Includes residents who may have been admitted more than once.

## 4.2 Separations

#### **Box 4.1: Separations**

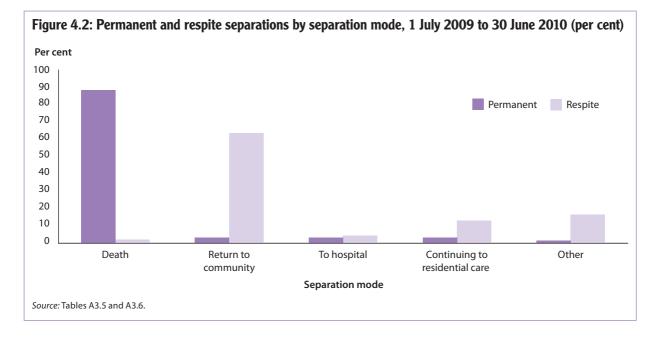

A separation occurs when a resident leaves residential aged care and has not re-entered the same or another service within 2 days.

The categories of reasons for separation (called the **separation mode**) are:

- death
- return to community
- · admission to hospital
- move to another aged care service
- other.

Between 1 July 2009 and 30 June 2010 there were 111,332 separations from residential aged care. Just over 54,190 separations were of permanent residents, which accounted for nearly half the total separations (49%), and around 57,140 were respite separations (51%) (Table A3.3).

Among permanent residents, death was the major reason for separation, accounting for 90% of cases (Figure 4.2). A small proportion of residents returned to the community (4%), whereas 3% moved to a different residential aged care setting. By contrast, just under two-thirds of separating respite residents returned to the community, and 14% moved to other residential care. Only 2% of respite residents separated due to death.

The distribution of separation modes for permanent residents was similar among the states and territories, however the Northern Territory had higher proportions of separations to hospital and return to the community than the other jurisdictions (Table A3.5).

More variation among the jurisdictions was evident for separations from respite care (Table A3.6). Tasmania had a relatively high proportion of respite residents returning to the community (82%), whereas this proportion was relatively low in both New South Wales and South Australia (55% and 59%, respectively). High proportions of residents in Western Australia and Queensland continued in residential aged care (20% and 17% respectively).

## 4.3 Length of stay

#### Box 4.2: Measuring length of stay

There are two standard measurements for length of stay:

- 1. **Length of stay of an existing resident** up to a particular point in time (in this publication, up to 30 June 2010). For existing residents, length of stay is an incomplete measure. It shows the amount of time residents have already spent in residential aged care, but not how much more time will be spent before leaving.
- 2. Total or completed **length of stay of a separated resident** up to the point of leaving residential aged care. If a resident moves from one service to another in less than 2 days (known as a transfer), then this is ignored, and the admission date used in the measure is the earlier admission date, or the first admission considering all transfers.

#### Length of stay of existing permanent residents

At 30 June 2010, almost one-third of existing permanent residents had been in residential aged care for 2–5 years (Table 4.2). Just over one-quarter had been in care for less than 1 year. One-fifth of residents had a length of stay between 1 and 2 years, while another fifth had been in care for 5 years or more.

The distribution of length of stay was similar across remoteness areas. There was a trend toward longer stay in *Remote* and *Very remote* areas, but this may be subject to more annual variation because of the relatively small numbers of residents in these areas.

 Table 4.2: Existing permanent residents, length of stay to date by sex and remoteness<sup>(a)</sup>, 30 June 2010 (per cent)

Length of stay	Major cities	Inner regional	Outer regional	Remote	Very remote	Australia

Total persons (number)	111,678	36,986	12,749	926	258	162,597

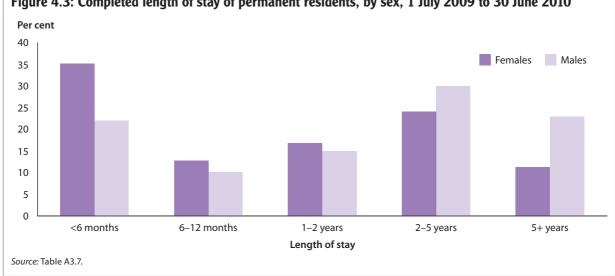

(a) Refers to the location of the services. The table uses the ASGC Remoteness Structure developed by the ABS.

#### **Completed length of stay**

For permanent residents who left residential care during the period 1 July 2009 to 30 June 2010, over one-third (38%) were in residential care for less than 1 year (27% for less than 6 months) (Table A3.7). Two-fifths (43%) had length of stay of between 1 and 5 years.

Almost half of all male residents had been in residential care for less than 1 year, compared with around one-third of females (48% and 32%, respectively) (Figure 4.3).

Most residents (90%) left due to death. Of these, one-fifth had stayed 5 years or more whereas one-quarter had been in care for less than 6 months. A small proportion of residents (4%) returned to the community; almost half of these (48%) had stayed for less than 3 months (Table A3.8).

## Figure 4.3: Completed length of stay of permanent residents, by sex, 1 July 2009 to 30 June 2010

## 4.4 Average length of stay

#### Permanent residents

Between 1 July 2009 and 30 June 2010, the average (mean) length of stay for permanent residents leaving residential care was 145.1 weeks (Table 4.3). Females on average stayed around 50% longer than males (167.6 compared with 108.5 weeks).

The average length of stay of residents at the time of separation varied slightly among the states and territories. Permanent separations in South Australia had the longest average length of stay (151.9 weeks) and those in the Northern Territory had the shortest (116.3 weeks). On average, stays in Remote areas were the shortest, at 129.0 weeks.

#### **Respite residents**

Between 1 July 2009 and 30 June 2010, the average length of stay for respite residents leaving residential care was 3.4 weeks (Table 4.4). The average length of stay varied among the jurisdictions from 3.9 weeks in New South Wales to 2.3 weeks in Tasmania. Across remoteness areas, the longest average length of stay was in Major cities at 3.6 weeks, with the lowest in Remote areas at 2.9 weeks.

From 1998–99 to 2009–10, the average completed length of stay for permanent residents has increased by around 10%, from 131.3 weeks to 145.1 weeks. By contrast, average completed length of stay for respite care has fluctuated in a narrow band around three and a half weeks (see Table 6.3).

## 4.5 Resident turnover

The amount of turnover in the residential aged care system is a function of the number of admissions, length of stay and the overall growth or reduction in the type and number of places in the system. It is calculated as the number of admissions over the financial year divided by the number of operational places.

Generally, the turnover for permanent and respite residents has been relatively stable from 2000–01 to 2009–10, with rates fluctuating in narrow bands (Table 4.5). Approximately one-third of permanent places are associated with new admissions in a year, whereas respite places are used about 14 to 17 times per year.

Type of care	2001-02	2002-03	2003-04	2004-05	2005-06	2006-07	2007–08	2008-09	2009–10

Turnover	0.63	0.65	0.64	0.63	0.63	0.62	0.61	0.64	0.64				

Table 4.5: Admissions and turnover, by type of care in residential aged care services, 2000–01 to 2009–10

Note: Turnover is calculated separately for permanent and respite residents by firstly allocating permanent and respite places according to the number of residents in each category as at 30 June 2010. Turnover is defined as admissions over the financial year divided by places.

## 4.6 Usage rates

A usage rate is a way of measuring patterns of use and access to services. It is similar to a provision ratio (see Box 2.3), but it looks at the number of *people* who are currently *using* a service, as a proportion of the people in the population that the service is for. In this section usage rates are expressed as a number per 1,000 of the population being considered.

For example, if a usage rate is 10 for a specific age group it would mean that there were 10 people for every 1,000 people in that age group who were *using* residential aged care during a particular time period. By comparison, a provision ratio of 10 would mean that, at a specific point in time there were 10 *places available* for every 1,000 people aged 70 years or more.

Usage rates for permanent residential aged care in this section have been calculated by English-speaking status (based on country of birth) and by Indigenous status.

#### Usage by English-speaking status

The total usage rate for permanent residents at 30 June 2010 was 23.7 per 1,000 persons aged 50 years and over (Table 4.6). The Australian-born group had higher usage rates than either the overseas-born English speaking or overseas-born non-English speaking groups (26.2, 20.8 and 17.8 per 1,000 people, respectively).

The number of Australian-born people receiving permanent care was estimated to be 112.2 per 1,000 aged 75 years and over. This was somewhat higher than among overseas-born English-speaking people of this age (102.2 per 1,000) and considerably higher than among overseas-born non-English speaking people (79.7 per 1,000).

- / 、		Overseas-born,	Overseas-born,

Table 4.6: Age- and sex specific rates for permanent residents	, by English-speaking status at 30 June 2010
(per 1,000 population)	

(a) LOTE = Language other than English.

Notes

1. Recipients with unknown status have been pro-rated across the overseas-born groups.

2. Due to the unavailability of regular population estimates by language preference, English-speaking status is based on country of birth. People born in Australia, Ireland, United Kingdom, New Zealand, United States of America, Canada and South Africa are assumed to be from an English-speaking background.

3. Population estimates by country of birth are derived from AIHW 2006.

#### Usage by Indigenous status

Usage rates for Indigenous Australians were higher at younger ages than in the non-Indigenous population (Table 4.7). The usage rate for Indigenous people aged 60–64 years was more than three times that for non-Indigenous people of this age, at 8.0 compared with 2.5 per 1,000. This trend was reversed among people aged 65 years or over, with the result that overall the non-Indigenous usage rate was much higher than that for Indigenous people (54.5 compared with 35.4 per 1,000).

	lı	ndigenous		Non-Indigenous			
Age (years)	Females	Males	Persons	Females	Males	Persons	
0–49	0.1	0.1	0.1	-	-	-	
50–54	1.6	3.5	2.5	0.5	0.6	0.6

65+	48.0	18.8	35.4	68.6	35.9	54.5	
Total	2.3	1.6	1.9	10.4	4.4	7.5	

Table 4.7: Age- and sex-specific usage rates for permanent residents, by Indigenous status<sup>(a)</sup>, 30 June 2010 (per 1,000 population)<sup>(b)</sup>

(a) Recipients with unknown status have been pro-rated across categories.

(b) Rates are calculated using ABS projections (ABS 2009) and the Australian population figures released in December 2010 (ABS 2010a).

## 4.7 Occupied place-days

The number of occupied place-days in a year is a good indicator of the level of activity in residential aged care.

Over the year from 1 July 2009 to 30 June 2010, 59.9 million place-days were used in mainstream aged care facilities in Australia. Most of these (58.5 million place-days, or 98% of the total) were for permanent care (Table 4.8 and Table A3.9).

As might be expected, the majority of permanent days were in *Major cities* (69%), and just under a quarter were in *Inner regional* areas (23%). There was a similar pattern for respite days, with a high proportion of occupied place-days in *Major cities* (63%), followed by *Inner regional* (26%). These proportions reflect the distribution of the older Australian population and the corresponding distribution of places (see Tables 2.2 and 2.4). Among the states and territories, the Northern Territory had the highest proportion of permanent occupied place-days in *Very remote* areas (10%), with all other states and territories having less than 1% of occupied place days in these areas (Table 4.8). Similarly, in the Northern Territory there was a relatively high proportion of respite occupied place-days in *Very remote* areas (17%).

(a) Refers to the location of the services. The table uses the ASGC Remoteness Structure developed by the ABS.

.. Not applicable.

## 4.8 Occupancy rate

The occupancy rate is calculated by counting day by day over a year the number of residents and counting day by day over a year the available places. The ratio of these two counts (as a percentage) is called the occupancy rate.

Between 1 July 2009 and 30 June 2010 the national occupancy rate was 92%, a slight decrease from the previous year (93%) (Tables 4.9 and 6.7). The occupancy rate ranged from 89% in the Northern Territory to 96% in Tasmania. Across remoteness areas, the occupancy rate was highest in *Inner regional* areas (94%) and lowest in *Very remote* areas (81%).

State/ territory	Major cities	Inner regional	Outer regional	Remote	Very remote	All regions

# Chapter 5

## Care needs of residents

# 5 Care needs of residents

The Aged Care Funding Instrument (ACFI) is a funding tool used to appraise a resident's dependency or need for care across three care domains: with Activities of Daily Living (ADLs), with behaviour (BEH) and with Complex Health Care (CHC) (see Box 5.1 and Appendix 4). Payment of care subsidies to service providers is based on the resident's ratings in each of these three domains.

Residents are appraised as having either *Nil* (meaning they have minimal or no need for assistance in that area), *Low, Medium* or *High* need for assistance in each of the three domains. Appraisal is based on 12 questions and assessments and diagnosed health conditions (Box 5.2). The assessment of their overall care level (high-or low-care) is based on the appraised level of care needs in these three domains (see Box 5.3). The ACFI also records up to three mental or behavioural diagnoses and up to three other medical diagnoses.

This chapter describes some patterns in the care needs of residents and provides new information about the incidence of the main medical conditions and dementia in permanent residents.

#### Box 5.1: The Aged Care Funding Instrument (ACFI)

An assessment undertaken with the ACFI is called an appraisal. Each ACFI appraisal has information on:

- up to three mental or behavioural diagnoses
- up to three other medical diagnoses
- five questions about the need for assistance with activities of daily living: nutrition, mobility, personal hygiene, toileting, and continence
- five questions on the need for assistance with the resident's behaviour: cognitive skills, wandering, verbal behaviour, physical behaviour and depression
- two questions on the need for assistance with the use of medication and complex health care procedures.

The resident's need for assistance in relation to each question is given a rating of A, B, C, or D and corresponds to a score, the scores are then added up and used to categorise the needs as *Nil, Low, Medium* or *High* within each of the three domains (for example, see Box 5.2). Subsidy levels are based on the resident's rating for each of the three funding/care domains (DoHA 2009b).

The ACFI replaced the Resident Classification Scale (RCS) on 20 March 2008 and is used to assess new residents (Box 5.3). Existing residents were reappraised using the ACFI on the anniversaries of their RCS appraisals. This transition process is now complete.

## 5.1 Overall level of care needed

Residents are classified as high or low-care residents based on their ACFI appraisal. The distinction between high and low-care is important because low-care residents with the means to do so are required to pay an accommodation bond either as a lump sum or through periodic payments. The criteria for defining ACFI high and low-care changed from 1 January 2010 (see Box 5.3, DoHA 2009f).

• Just over 60% of new admissions to residential aged care facilities from 1 July 2009 to 30 June 2010 required high-level care (Table 5.1).

- Over 70% of permanent residents at 30 June 2010 required high-level care, representing a decrease from 2008–09 (75%) (Tables 5.1 and A4.1).
- The proportion of younger residents (aged under 65 years) requiring high-level care at 30 June 2010 was much higher (81%) (Table 5.1). Younger residents are not usually admitted to residential aged care unless no other suitable disability service is available.

## Table 5.1: Dependency levels of permanent residents at admission 1 July 2009 to 30 June 2010, permanent residents, and younger people (aged under 65 years) at 30 June 2010 (per cent)

	New admissions, 1 July 2009 to 30 June 2010				inent reside ) June 2010	nts,	Younger residents (< 65 years), 30 June 2010			
Sex	High-care	Low-care	Total	High-care	Low-care	Total	High-care	Low-care	Total	
Females	57.9	42.1	100.0	71.1	28.9	100.0	84.5	15.5	100.0	
Males	68.0	32.0	100.0	72.0	28.0	100.0	77.8	22.0	100.0	
Persons	61.7	38.3	100.0	71.3	28.7	100.0	80.8	19.2	100.0	

Note: The estimates apply the new ACFI rules retrospectively and this creates a series break.

The estimates applying the new rules only to permanent admissions after 1 January 2010 are included in Table A4.1.

#### Box 5.2: Defining low- and high-care under the ACFI from 1 January 2010

Under the new definition, for a resident to be assessed as high-care, they must have:

- a score of high in the ADL domain; or
- a score of high in the CHC domain; or
- a score of high in the BEH domain together with a score above nil in at least one of the ADL and CHC domains; or
- a score of medium or high in at least two of the three domains.

Otherwise a resident is classified as low-care.

#### Care levels across domains

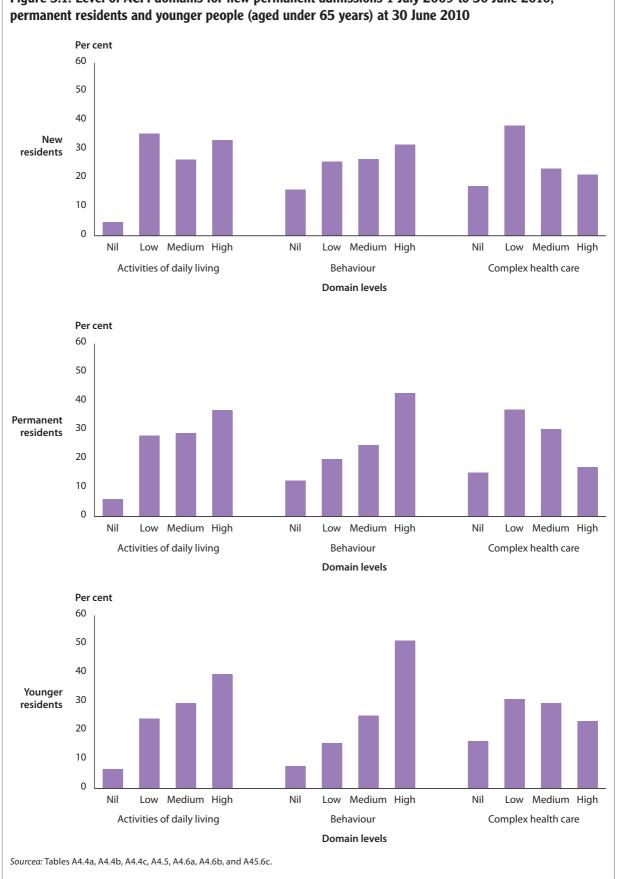

Overall, there were nearly 127,400 permanent residents at 30 June 2010 with an ACFI appraisal of high-care (Table A4.2).

- Nearly 8% had a high-care classification across all three domains.
- 11% of high-care residents were appraised as having a *High* across the ADLs and Behaviour domains and a *Medium* in the Complex Health Care domain. This was the most common combination of care needs for high-care residents.
- Just over 34,200 residents had a low-care appraisal (Table A4.3).
- Almost 7% of low-care residents required only minimal or no assistance with all three areas of care and so received a *Nil* rating for all domains.
- 18% of low-care residents were appraised as a *Low* across all domains. This was the most common combination for low-care residents.

## 5.2 ACFI appraisals on admission

From 1 July 2009 to 30 June 2010 there were about 55,500 permanent resident admissions with an ACFI appraisal:

- Most new residents needed some level of assistance with ADLs, 33% appraised as *High*, 27% appraised as *Medium* and 35% appraised as *Low* (Figure 5.1).
- One third of new residents (32%) were appraised as *High* in the BEH domain, while around a quarter were appraised as *Medium* (27%) and 26% as *Low*.
- New residents were less likely to need assistance with complex health care than with ADLs or behaviour, with only a fifth (21%) of new residents appraised as *High* in this domain, and over half appraised as *Low* or *Nil* for this domain.
- New residents were more likely to have low or no need for care with behaviour or complex health care (16% and 17% respectively) than with ADLs where only 5% had minimal or no care needs.
- Overall, a greater proportion of male admissions were appraised as *High* in all three domains, though the differences between the sexes varied somewhat by age.

## Figure 5.1: Level of ACFI domains for new permanent admissions 1 July 2009 to 30 June 2010,

Residential aged care in Australia 2009–10: A statistical overview

#### Variation by age

Across age groups:

- the youngest (less than 65 years) and the oldest (95 years and over) residents had the highest ADL needs, with 39% and 45% respectively appraised as *High* in ADL's (Table A4.4a).
- the number of residents appraised as having a *High* in the BEH domain became less common with age, from 42% of those under 65 years to 26% of those aged 95 years or over (Table A4.4b).
- younger new residents were also more likely to be appraised as *High* in Complex Health Care (30% of those less 65 years, and 29% of those aged 65–69 years) than those entering care at an older age (18% of those aged 85–94 years, and 21% of those 95 years or older).

These differences may indicate that difficulty with carrying out activities of daily living and behavioural issues may have a greater influence than health conditions on the decision to enter care for most new residents. The high proportion of younger people entering residential care with higher care needs may also reflect the relatively high number of people in these age groups who enter care because of more severe health conditions including acquired brain injury, stroke or early onset dementia.

#### Variation by state

The distribution of care levels varied somewhat across the states and territories (Tables A4.11a, A4.11b and A4.11c). South Australia had the largest proportion of residents with a classification of *High* in all three domains: 37% with *High* needs in activities of daily living (33% nationally), 40% with *High* care behaviour needs (32% nationally) and 31% with *High* complex health care needs (21% nationally).

## 5.3 ACFI appraisals for permanent residents

The distribution of ACFI care levels across the three domains for all permanent residents in care at 30 June 2010 (Table 5.2) was generally similar to that seen for new residents admitted during the year (see Figure 5.1). However:

- the proportion of residents with Medium and High in the ADL domain was slightly higher
- existing residents were more likely than new residents to be appraised as *High* in the BEH domain (43% of all residents were appraised as *High* compared with 32% of new residents) and
- the proportion of all permanent residents with a *Medium* in the Complex Health Care domain was higher than that for new residents (30% compared with 23% respectively) while those appraised as *High* were lower (17% compared with 21% respectively).

These slight differences in the patterns of appraisals for all residents and for new residents generally reflect the care needs of existing older residents who make up the majority of residents; around three-quarters of existing residents were 80 years or older, and nearly 3 in 10 (28%) were aged 85 to 89 years. This is true both for new residents during the year and all residents at 30 June 2010. Frailty increases as people age, as do the proportions of people with chronic health conditions. The care needs of residents entering residential aged care are generally lower than those of a similar age who are already living in residential care.

#### Variation by age

Variation in the distribution of appraisals in the three domains was evident across age groups (Table 5.2):

- Residents aged 95 years and over were most likely to be appraised as *High* care in the ADL domain (43%). Within this age group, females were more likely than males to be appraised as *High* (44% compared with 37%); in contrast, males were more likely than females to be appraised as *High* in ADLs.
- The widest variation was seen within the BEH domain. As age increased, the proportion of residents appraised as *High* decreased. Just over half of residents aged under 65 years were appraised as *High* (51%), steadily decreasing to 37% of those aged 95 years and over.
- This same trend was evident within the CHC domain, with 23% of residents aged under 65 years appraised as *High*, reducing to 17% of those aged 95 years and over.

The care needs of younger residents are discussed further in section 5.4.

Table 5.2: ACFI domain for permanent residents, by age group at 30 June 2010 (per cent)

Total (number)	6,438	5,230	9,066	16,990	32,915	45,851	31,378	13,726	161,594				

#### Variation by state

As with new residents, there was some variation in care levels for all residents across the states and territories (Table A4.12a, Table A4.12b and Table A4.12c). Greater proportions of residents in South Australia were appraised as *High* in the BEH and CHC domains compared with other jurisdictions, while residents in the Northern Territory were more likely to be appraised as *High* care needs in the ADL domain. A relatively high proportion of residents in Tasmania had a *Nil* in BEH (18% compared with the national average of 12%).

## 5.4 ACFI for younger residents

At 30 June 2010 there were just over 6,400 permanent aged care residents under the age of 65 years, accounting for around 4% of permanent residents. Almost all had been appraised using the ACFI.

- The need for care with ADLs was generally similar to that for all residents although younger residents had a slightly lower proportion with *Low* care needs and a slightly higher proportion with a *High* care need (see Figure 5.1).
- Younger residents were more likely to have high-level care needs in the BEH and CHC domains:
  - Half (51%) of young permanent residents required high-level care in the BEH domain compared with 43% of all residents. Those aged 50–54 years were the most likely to be appraised as *High* in the BEH domain (55%).
  - In the CHC domain, 23% of young residents required high-level care, compared with 17% of all residents.
     However, CHC needs were much more common in the youngest residents, with almost half of those aged less than 40 years requiring high-level care in this domain.

Analysis of the main health conditions of younger people in residential care could be useful in explaining the care needs of younger residents. It is probable that many of these younger residents have medical diagnoses such as acquired brain injury, stroke, early onset dementia or other conditions associated with higher care needs.

Younger people are not generally accepted into residential aged care unless there are no other more suitable disability services available for them. The Younger People with Disability in Residential Aged Care (YPIRAC) program is a 5-year program agreed on by the Council of Australian Governments which aims to reduce the number of people with disability aged less than 65 who live in residential aged care. More information about that program and the characteristics of younger residents is published in the report *Younger people with disability in residential aged care: update from the 2009–10 minimum data set* (AIHW 2011d).

## 5.5 Separation mode by ACFI level of care

Between 1 July 2009 and 30 June 2010, 52,615 permanent residents with an ACFI appraisal separated from residential care. The main reason for separation was death (91%) (Table 5.3). A small proportion (3%) returned to the community, while 3% were discharged to hospital.

Death was the most common reason for separation among residents appraised as having *High* care needs within the ADL, BEH, and CHC domains (96%, 93% and 95% respectively). As requirements for care decreased, residents were less likely to separate due to death. As might be expected, residents with lower-level care needs were more likely than those with higher care needs to return to the community.

		AC	FI care level

## Table 5.3: ACFI level of care for ADL, BEH and CHC at separation, for permanent residents separating between 1 July 2009 and 30 June 2010, by separation mode (per cent)

## 5.6 Length of stay by ACFI level of care

The relationship between ACFI levels of care and length of stay for separated residents is complex. This analysis attempts to look for a relationship between the resident's assessed care needs in each domain and the time they stayed in residential aged care. However, most residents (90%) separate (that is, stop receiving care) because they die, and the cause of death (which is the reason they left care) may not necessarily be a pre-existing condition. In addition, a resident's overall situation is a combination of the need for care in all three areas, and any existing health conditions. Consequently, this analysis can ever only partially explain the relationship between the residents care needs and length of stay.

- Residents appraised as High in Complex Health Care were more likely to have a shorter length of stay:
  - 29% had been in care for less than 3 months at the time of separation (Table A4.9c)
  - only 28% stayed more than 3 years.
- In comparison, 39% of residents with *High* in the BEH domain and 38% of residents with *High* in the ADL domain stayed more than 3 years (Tables A4.9a, A4.9b and 4.9c).
- Those with *High* in the ADL domain were more likely than others to have either a short length of stay of less than 3 months, or to stay long-term (5 years or more) (Table A4.9a) while those with either a *Medium, Low* or *Nil* appraisal for this domain were more likely to stay around 1 to 3 years.
- Those with *High* in the BEH domain were more likely to have longer lengths of stay, with 21% staying 5 years or more compared with 12% of those with a Nil in this domain (Table A4.9b).

## 5.7 Health conditions

The ACFI allows reporting of up to three of the resident's most significant diagnoses in each of two categories: mental and behavioural conditions, and other health conditions. The main categories reported for health conditions (excluding mental and behavioural disorders) are provided in Table 5.4.

All permanent residents at 30 June 2010 who had an ACFI appraisal had at least one health condition reported. The data presented here relate to the condition listed first on the survey form.

- The most common types of condition listed were circulatory system diseases (25%) (Table 5.4). These conditions include heart disease, cerebrovascular disease (including stroke) and hypertension.
- Diseases of the musculoskeletal system and connective tissue (which includes rheumatoid arthritis, osteoarthritis and osteoporosis) were the first condition listed for 17% of residents.
- Around 8% of residents had endocrine, nutritional and metabolic disorders, such as diabetes, as their first listed medical condition.

## 5.8 Dementia and mental illness

Dementia and mental illness have been acknowledged as important challenges to health and aged care policy. Dementia is a highly disabling neurological disorder which is most often experienced by those aged 80 years and over (AIHW 2007).

Diagnoses of up to three mental and behavioural conditions may be recorded in ACFI appraisals. At 30 June 2010:

- Over three quarters of residents (77%) were reported to have a mental health issue (Table A4.10). This may be an underestimate, as information was missing for nearly 10% of residents.
- More than half (52%) of the 161,594 permanent residents with ACFI appraisals had a diagnosis of dementia recorded (Figure 5.2). A small number of residents (less than 1%) also had a dementia diagnosis recorded in the fields reserved for medical diagnoses.
- Two-fifths of residents with dementia also had a diagnosis of a mental illness.
- A further 25% of residents had a diagnosis of mental illness without a diagnosis of dementia.

Further information about dementia in aged care residents is available in the AIHW report *Dementia among aged care residents: first information from the Aged Care Funding Instrument* (AIHW 2011b).

## Chapter 6

## Trends in the use of residential aged care

# 6 Trends in the use of residential aged care

This chapter presents trend data for selected information about residential aged care in Australia. The time period used varies depending on data availability.

## 6.1 Overall usage

Over the past decade, there has been an increase in the number of permanent and respite residents in residential aged care due to the ageing of the population and the corresponding increase in the number of residential places. Of note is the increase in the number and proportion of residents aged 85 years and over (Table 6.1).

From 1999 to 2010:

• the numbers of permanent residents increased by nearly 30,200 (23%)

the proportion of permanent residents who were aged 85 years or over increased by 41%, almost 27,000 additional older residents, from 49% to 56% of all residents

in other words, 89% of the increase in permanent residents was accounted for by those 85 years old or over.

• the numbers of residents receiving residential respite care at 30 June increased by nearly 1,300 (52%).

the proportion of respite care residents aged 85 years and over increased by 98%, just over 880 older residents, from 36% to 47% of respite care residents.

In other words, 68% of the increase in respite care residents was accounted for by those 85 years or older.

Year	All permanent residents	All respite residents	Permanent residents (85+ years)	Respite residents (85+ years)	Permanent residents (85+ years) (per cent)	Respite residents (85+ years) (per cent)
1999	132,420	2,479	64,638	903	48.8	36.4
2000	133,387	2,604	66,503	1,034	49.9	39.7
2001	134,004	2,604	67,402	1,008	50.3	38.7
2002	136,507	2,422	69,258	1,035	50.7	42.7
2003	140,297	2,549	71,397	1,024	50.9	40.2
2004	144,994	2,646	74,229	1,097	51.2	41.5
2005	149,091	2,819	77,285	1,174	51.8	41.6
2006	151,737	3,135	80,099	1,334	52.8	42.6
2007	153,426	3,123	82,871	1,445	54.0	46.3
2008	157,087	3,163	85,912	1,487	54.7	47.0
2009	158,885	3,404	88,030	1,644	55.4	48.3
2010	162,597	3,773	91,462	1,787	56.3	47.4

#### Table 6.1: Trends in resident numbers at 30 June, 1999–2010

The age of residents at admission to residential aged care has also been increasing (Table 6.2). From 1998–99 to 2009–10:

- the proportion of permanent residents aged 80 years and over at the time of admission increased:
- nearly 10 percentage points for permanent residents from 64% to 74%
- around 11 percentage points for respite residents from 60% to 71%
- the proportion of residents aged 90 years and over increased more slowly:
- from 15% to 20% for permanent residents and
- from 12% to 19% for respite residents.

## Table 6.2: Proportion of residents aged 80 years and over, and aged 90 years and over at admission,1998-99 to 2009-10 (per cent)

Year	Permanent (80+ years)	Respite (80+ years)	Permanent (90+ years)	Respite (90+ years)
1998–99	64.1	59.7	14.8	12.4
1999–00	65.2	60.0	15.8	13.5
2000-01	67.0	61.9	16.8	14.0
2001-02	68.3	62.6	17.5	14.4
2002–03	69.0	64.2	18.2	15.2
2003–04	70.0	65.2	18.3	16.0
2004–05	70.0	65.0	18.9	16.4
2005-06	70.9	66.3	19.4	17.0
2006–07	71.5	67.9	19.9	18.0
2007–08	72.7	68.9	20.3	18.5
2008–09	73.0	69.9	20.5	18.7
2009–10	73.6	70.9	20.4	19.0

Note: Transfers are excluded from admissions.

## 6.2 Admissions, separations, and completed length of stay

From 1998–99 to 2009–10, consistent with the increased supply of places, both permanent and respite admissions rose, as did the number of separations from permanent and respite care (Table 6.3). Average completed length of stay in permanent care increased during this period, while length of stay in respite care remained much the same.

For permanent care:

- the number of admissions increased by 28% (just under 12,700)
- the number of separations from care increased by 23% (around 10,100), and
- the average completed length of stay for residents:
  - increased by approximately fourteen weeks (11%)
  - varied somewhat over the 10 year period from 142.4 weeks in 2000–01 to a high of 147.8 weeks in 2007–08.

- admissions increased by 41% (just under 16,700)
- separations increased by 40% (16,200)
- the average completed length of stay remained relatively stable during this time at three to three and a half weeks.

## Table 6.3: Admissions, separations and completed length of stay in residential aged care, 1998–99 to 2009–10

Year	Permanent admissions	Respite admissions	Permanent separations	Respite separations	Average completed length of stay (permanent, weeks)	Average completed length of stay (respite, weeks)
1998–99	45,258	40,806	44,079	40,939	131.3	3.5
1999–00	45,476	42,531	44,615	42,422	137.0	3.3
2000-01	46,545	43,606	45,481	43,586	142.4	3.2
2001-02	47,345	43,309	45,284	43,503	145.5	3.2
2002-03	51,200	45,445	47,467	45,334	143.0	3.1
2003–04	53,356	46,632	48,723	46,544	143.7	3.1
2004–05	52,462	48,295	48,503	48,120	143.3	3.1
2005–06	52,964	49,727	50,720	49,402	145.8	3.1
2006–07	52,196	50,987	51,026	50,977	145.9	3.3
2007–08	53,737	51,293	53,819	51,280	147.8	3.3
2008–09	56,983	54,535	55,310	54,291	147.0	3.4
2009–10	57,937	57,503	54,193	57,139	145.1	3.4

Note: Transfers are excluded from admissions and separations.

### 6.3 Transition from respite care to permanent care

Residential respite care plays an important role in the aged care system. Just under half of all admissions to residential aged care in 2009–10 were for respite care (Table 6.3), and a substantial proportion of respite residents were subsequently admitted into permanent residential care (Tables 6.4).

In 2009–10, there were 57,503 respite admissions for nearly 41,900 individuals.

- Just under half (49%) of these individuals were then admitted to permanent care.
- Over one-third (36%) of the respite admissions resulted in permanent admissions.

Year	Number of respite admissions	Respite residents	Permanent admissions following respite admission (1 per resident)	Permanent admissions following respite admission (%)	Respite residents admitted for permanent care (%)
1999–00	40,806	32,902	14,017	30.1	42.6
2000-01	42,531	33,263	14,288	30.0	43.0
2001-02	43,606	32,871	13,934	29.5	42.4
2002-03	43,309	34,193	14,661	29.6	42.9
2003-04	45,445	35,021	15,098	29.8	43.1
2004-05	46,632	36,181	15,361	29.2	42.5
2005-06	48,295	37,505	16,325	30.0	43.5
2006-07	49,727	38,919	17,341	31.0	44.6
2007–08	50,987	39,530	17,729	31.5	44.8
2008-09	54,535	41,972	19,250	32.2	45.9
2009–10	57,503	41,847	20,499	35.6	49.0

#### Table 6.4: Respite residents and permanent residential aged care activity, 1999–00 to 2009–10

#### 6.4 Permanent residents and usage rates by age

Between 2000 and 2010 there was a steady increase in both the number and proportion of permanent residents aged 85 years or older (Table 6.5):

- The proportion of those aged 85 or older increased steadily from 50% of permanent residents at 30 June 2000 to 56% at 30 June 2010. This represents an increase from 66,500 to nearly 91,500 people.
- While there has been an increase of just under 5,200 in this period, the numbers of residents aged 80 to 84 years peaked at 33,600 residents 2005 and has fluctuated between around 33,000 to 33,200 over the last four years, and the proportion of residents in this age group has been slowly decreasing since 2004.
- In contrast, the number and percentage of residents in all of the younger age groups has generally changed little or decreased over this ten year period.

Usage rates per 1,000 population in each age group generally declined over the period in all age groups (Table 6.6).

- The strongest decline was in the 85 years and over age group, which dropped from 263.2 per 1,000 in 2000 to 229.7 per 1,000 in 2010.
- This was followed by the 80–84 years age group, where usage rates fell from 90.5 to 75.5 per 1,000.

Age group

Total	7.0	6.9	7.0	7.1	7.2	7.3	7.3	7.4	7.4	7.3	7.3

#### 6.5 Occupancy rates

Between 1998–99 and 2009–10, the occupancy rate at the national level fluctuated in a narrow band between 92% and 96%, but with a declining trend since 2002–03 (Table 6.7):

- Over this period, South Australia and Tasmania averaged high occupancy rates with little variation.
- The Australian Capital Territory and the Northern Territory showed greater variability.

While the number of residential care places has been increasing over this period, so has the availability of Commonwealth-funded packaged care for people who are eligible for residential aged care. The objective of these alternatives is to allow people to stay at home as long as possible and has no doubt had some influence on occupancy rates in residential aged care.

- At 30 June 2010 there were:
  - 43,300 Community Aged Care Packages compared with 13,896 at 30 June 1999 (Table 2.1)
  - 8,167 EACH and EACH Dementia packages, neither of which program existed in 1999
  - 2,698 Transition Care places, each of which can help around 6 people a year and has been successful in helping people leaving hospital return to the community (AIHW 2011c).
- People who are eligible for residential aged care may also be using other community care programs such as Home and Community Care and the National Respite for Carers Program, to help them stay in their own homes.

Year	NSW	Vic	Qld	WA	SA	Tas	ACT	NT	Australia

#### Table A2.9 (continued): Income source of permanent residents, by sex and state/territory<sup>(a)</sup>, 30 June 2010

(a) Refers to the location of the services.

Notes

1. 'DVA' refers to the Australian Government Department of Veterans' Affairs. Other pensions are administered by Centrelink.

2. The category 'Unknown' refers to residents not yet assessed by Centrelink or DVA at the time of reporting.

# Appendix 4: Aged Care Funding Instrument

The Aged Care Funding Instrument (ACFI) replaced the Resident Classification Scale (RCS) for determining the level of care payments for residents in aged care homes from 20 March 2008. It is designed to provide a simpler method that better matches funding to the needs of people with dementia and those with complex health care needs. All new permanent admissions from 20 March 2008 were appraised using the ACFI and conversion from the RCS for existing residents occured on the annual re-appraisal date.

The ACFI measures the need for care using standard assessment tools and the completion of ACFI checklists. It involves the appraisal of residents in relation to three separate domains that are considered to contribute to the costs of care: Activities of Daily Living, Behaviour, and Complex Health Care supplement. Each of these domains has three funded levels—low, medium and high. In addition, there is a 'lowest applicable classification level' in each domain, which results in nil funding.

Activities of Daily Living (ADLs) evaluate client needs with nutrition, mobility, personal hygiene, toileting and continence.

**Behaviour (BEH)** assesses resident care needs in respect of cognitive skills, wandering, verbal behaviour, physical behaviour and depression.

Complex Health Care (CHC) measures client needs for medication/complex health care.

In addition, there are two categories of health condition diagnosis (Mental & Behavioural and Medical) which result in a record of diagnosed disorders. Diagnoses data are used to support other ratings and to determine whether supplementary funding is required. Coding of health conditions in the ACFI comes from codes used in the Aged Care Assessment Program and these codes map to equivalent codes in the International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification (2008) (also known as ICD-10-AM).

ACFI classifications are defined as high- or low-care. Up to 31 December 2009, to be considered high-care, the resident must be classified at one or more of the following levels:

- medium or high in the CHC domain; OR
- medium or high in the ADL domain; OR
- high in the BEH domain.

If a resident appraisal does not satisfy these conditions, they will be classified as low-care.

### Box A4.1: High-care criteria

The criteria for ACFI high and low-care changed from 1 January 2010. Under the new definition, for a resident to be assessed as high-care, they must have:

a score of high in the ADL domain; OR

a score of high in the CHC domain; OR

a score of high in the BEH domain AND a score above nil in at least one of the ADL and CHC domains; OR

a score of medium or high in at least two of the three domains.

Otherwise a resident is classified as low care.

ACFI classifications will not generally expire, except in certain circumstances including:

- 6 months after a resident enters care directly from hospital
- 6 months after re-classification on the grounds of a major change in care needs
- The day prior to the resident's return from extended hospital leave (of 30 days or more)
- 6 months after return from extended hospital leave
- upon departure from care, except if transferring to another home within 28 days.

ACATs will continue to make recommendations for either high- or low-level residential care.

#### Table A5.1 (continued): Population, by age, sex and state/territory, 30 June 2010

Source: ABS estimated resident population at 30 June 2010, estimates released in December 2010, excluding external territories (ABS 2010a).

# Appendix 6: Financial support arrangements

The financial support arrangements are recorded by referring to the time a resident first entered aged care. All permanent residents in aged care at 30 June 2010 were assessed under different financial eligibility criteria, depending on when they were first admitted to care. The *Aged Care Act 1997* introduced major changes to the structure and funding of aged care services. The criteria used to assess financial assistance have changed twice since October 1997 when the *Aged Care Act 1997* was first passed, resulting in three different financial assessment periods:

- 1. pre-reform (pre-October 1997)
- 2. 1 October 1997-19 March 2008
- 3. 20 March 2008 onwards.

#### **Pre-reform**

This time period refers to financially disadvantaged permanent residents who were admitted to care prior to 1 October 1997.

## 1 October 1997–19 March 2008

Permanent residents receiving financial support during this time were referred to as concessional and assisted residents.

Concessional residents who met the criteria for concessional status were eligible for a concessional supplement, which was paid to the service provider. Concessional residents were exempt from accommodation changes or bonds. In addition, a concessional supplement to the basic subsidy was paid to the service provider. The minimum requirements for concessional status were that the resident must:

- · be receiving an income support payment
- not have owned a home for the past 2 years
- have assets of less than 2.5 times the annual single basic aged pension, rounded to the nearest \$500.

Assisted residents were also eligible for a supplement; however, this was lower than for concessional residents. Assisted residents may have also been required to pay an accommodation bond or an accommodation charge, subject to certain conditions.

Service providers received a lower supplement for assisted residents. The criteria for determining assisted resident status were the same as concessional resident status except that:

• an assisted resident has assets of between 2.5 and 4 times the annual single basic aged pension amount, rounded to the nearest \$500.

#### 20 March 2008 onwards

Financially disadvantaged permanent residents admitted to care from 20 March 2008 are referred to as supported residents. Existing residents prior to 20 March 2008 retain their conditions and benefits for being financially disadvantaged unless they separate from residential aged care for more than 28 days. Clients entering permanent residential aged care may be eligible to be supported residents (on or after 20 March 2008) depending on the value of their assets.

An assets test is undertaken to determine eligibility for a supported resident. Fully supported residents are similar to concessional residents, but a sliding scale of accommodation charges applies as their assets increase. Partially supported residents pay some level of accommodation charge depending on their assets.

A client's home is excluded from this assets test if the home is occupied by either:

- their partner or a dependent child
- their carer, who is eligible for an income support payment, and has occupied the home for the past two years
- a close relation, who is eligible for an income support payment, and has occupied the home for the past five years.

For a full description of details for residents and providers about assisted and concessional status, see *The residential aged care manual* maintained by the Australian Government Department of Health and Ageing, available on their website at <www.health.gov.au>.

Facilities are expected to meet regional targets for places for concessional, assisted and supported residents. These targets range from 16% to 40% and are calculated using the Socio-Economic Indexes for Areas (SEIFA) applied to aged care planning regions.

# Appendix 7: Data sources and limitations

#### **Resident data**

The main source of resident data in this report is administrative by-product data from the System for the Payment of Aged Residential Care (SPARC) and the National Approved Provider System (NAPS).

SPARC contains information gathered through a number of instruments. Among those instruments, the following three are directly relevant to this report:

- Aged Care Application and Approval—a form completed by a person applying for admission to an aged care service or by someone (normally a carer) on behalf of the applicant.
- Application for Classification—a form containing client evaluation on the Resident Classification Scale (RCS) and completed by the aged care service to determine the resident's overall level of care needs (used up to 20 March 2008). From 20 March 2008, this form was revised to adjust to client appraisal using the Aged Care Funding Instrument (ACFI).
- Monthly Claim Form—a form for claiming Australian Government benefits completed by the aged care service as part of the monthly funding cycle.

The initial transfer of this information is moving from paper copy to electronic transfer. The word 'form' thus needs to be interpreted accordingly.

Residential aged care in Australia was restructured in 1997–98. The two separate categories of residential care (nursing homes and hostels) were combined into a single program from 1 October 1997. As a result, from that date, SPARC replaced the two previous data collection systems: the Nursing Home Payment System (NHPS) and the Commonwealth Hostel Information Payment System (CHIPS).

The new system inherited all records on NHPS. For CHIPS data, only those records that related to the following two groups of people were carried over:

- those who were in a hostel at 1 October 1997
- those who had a valid ACAT assessment covering 1 October 1997, as they were regarded as potential residents.

In other words, the records for residents discharged from hostels, and all payment details for all hostel residents before 1 October 1997, are not available on SPARC although they are still available on CHIPS.

Under the amalgamated residential aged care system, length of stay refers to the period spent in the combined system, which may include both time spent under low-care (previously hostel) and high-care (previously nursing home). This is not comparable to combining length of stay measures from the previous separate nursing home and hostel measures of length of stay.

# **General population data**

Population data are from the AIHW's general population databases supplied by the ABS, and other ABS published data.

# **Resident information**

All residents admitted to residential aged care must have a valid Aged Care Client Record form completed by an authorised ACAT officer. This form is valid for 12 months from the date of an approval for low-level care. An approval for high level care does not lapse.

The information entered into SPARC from the Aged Care Application and Approval form is the major source for the following data items in the tables:

- sex
- date of birth
- marital status
- Indigenous status
- country of birth
- preferred language
- resident's usual residence (before admission)
- resident's usual living arrangement (before admission).

Not all residents have all the above characteristics reported in SPARC.

## **Application for classification**

These forms are now sent directly to Medicare Australia in either electronic or paper form and processed for funding purposes according to the information provided. On the old RCS, a client would normally be reappraised annually on the anniversary of admission by the service provider. The RCS has been replaced with the ACFI from 20 March 2008 and the ACFI was phased in over a year as client RCS appraisals become due. There is no automatic reappraisal of clients in the ACFI appraisal system.

## Admission and separation date

The monthly claim form is sent to approved residential aged care facilities each calendar month, either electronically or as a paper form, as part of the payment cycle. It shows claim details for the previous month plus a forecast schedule for the current month. The facility checks the information and records data on separations and absences (hospital and social leave) for these residents. The facility also adds information on any newly admitted residents for the current month.

The monthly claim form is sent to Medicare Australia. The claim form is the source for the following data items in the tables:

- date of admission
- date of separation
- separation mode
- admission type.

#### **Calculation of provision ratios**

The ratios may differ slightly from those output by the Australian Government Department of Health and Ageing, due to minor differences in the calculation method.

#### Populations used in the tables in this report

Tables in this publication refer to several different sub-populations and, consequently, may not be directly comparable. The sub-populations covered in this report are summarised below. Excluding the reporting on provision, the data presented relate to mainstream services and their residents, and exclude residents in places provided by Multi-Purpose Services or funded through the National Aboriginal and Torres Strait Islander Flexible Aged Care Program, and Innovative Pool places.

#### Residents at 30 June 2010

All tables on this topic relate to the number of residents who were in mainstream aged care services on 30 June 2010. This population includes all approved residents and totalled 166,370.

#### All admissions and separations, 1 July 2009 to 30 June 2010

There were 57,937 admissions for permanent care (permanent admissions) and 57,503 admissions for respite care (respite admissions) over the period 1 July 2009 to 30 June 2010. Over the same period, there were 54,913 separations of permanent residents and 57,139 separations of respite residents. Transfers within type are excluded.

#### Admitted residents, 1 July 2009 to 30 June 2010

Each person is counted once. For the full year reporting, there were 56,913 distinct resident admissions for permanent care and 41,654 distinct resident admissions for respite care. Transfers within type are excluded.

#### Separated permanent residents, 1 July 2009 to 30 June 2010

Each person is counted once. For the full year reporting, there were 53,572 distinct permanent resident separations. Transfers are excluded.

#### Tables on dependency

The data on the ACFI invariably excludes some clients due to the time lag in data entering the warehouse from which the tables are derived, and the programming structure which cannot allow for the full range of unusual data entry. The general trends in these tables are not altered by the missing data.

## **Data limitations**

The accuracy of certain data items might be limited. Such cases are listed below:

- A reported date of birth implying that a resident is aged less than or equal to 10 years is regarded as an input error and 100 years is added to the age. This only alters a handful of entries in any one year.
- Death indicator: in some cases, aged care services may not be equipped to care for some terminally ill residents. Accordingly, such residents are transferred to acute-care institutions before death; hence, there is an under-enumeration of discharges due to death.
- Length of stay: complete length of stay of a resident is the time between the date of admission and the date of separation; and for residents at 30 June 2009, incomplete length of stay is the time between the date of admission and 30 June 2009. When a person is transferred from one service to another, the date of admission to the first service is the date from which the length of stay is calculated.
- The data on the number of residential places and community care packages stored in the Aged and Community Care Management Information System (ACCMIS) is sourced from the National Approved Provider System (NAPS) and are sensitive to dates of entry. Consequently, the reader may find minor reporting variations depending on the version of ACCMIS used in the variety of reports on aspects of residential aged care.
- Information on whether an admission was from an acute hospital is not available in SPARC.

## **Calculations**

Cases where data are not applicable, unknown or not reported have mostly been excluded in relevant calculations of percentages and rates presented in the text, which may create minor variance to the totals in relevant tables. This is the equivalent of distributing missing and unknown responses across known categories according to the relative numerical contribution of the known categories to the total of known responses (sometimes referred to as 'pro-rating').

## Glossary

#### Aged Care Funding Instrument (ACFI)

The ACFI is a resource allocation instrument and focuses on three domains that discriminate care needs among residents. The ACFI assesses core needs as a basis for allocating funding. It was phased in over a year starting from 20 March 2008 to replace the RCS. See Chapter 5 for more detail.

#### Admission day

The first day of a person's stay in an aged care service. In the case of a person transferring between services, where the time between leaving one service and entering another is less than 2 days, it is the date of the initial admission. Permanent and respite admissions are treated separately. For example, if a person transfers from a respite stay to a permanent stay, a new permanent admission is created.

#### Aged Care Assessment Team (ACAT)

A multidisciplinary team of health professionals responsible for determining eligibility for entry to residential aged care and other types of care under the *Aged Care Act 1997*.

#### **Care recipient**

A person assessed by an ACAT as having significant care needs, which can be appropriately met through the provision of residential care, community care, and/or flexible care.

#### **High-care resident**

A permanent resident who was assigned to classification levels 1–4 using the RCS or who is appraised as ACFI high-care.

#### Length of stay

The length of stay of a separated resident is based upon the time between the date of admission and the date of separation, allowing for transfers. For a current resident, it is the time between the date of admission and 30 June 2009. The admission day and the specified day (30 June 2009) are included, but the separation day is excluded, from the calculation of length of stay.

#### Low-care resident

A permanent resident who was assigned to classification levels 5–8 using the RCS or who is appraised as ACFI low-care.

#### **Mainstream places**

Residential aged care places that exclude residents in MPS's and National Aboriginal and Torres Strait Islander Flexible Aged Care Programs.

#### **Occupied place days**

Occupied place-days are calculated by multiplying the number of residential aged care places available by the number of days each of these places were used by residents.

#### **Permanent admission**

An admission to residential aged care for expected long-term care.

#### Permanent care

A resident in residential aged care is under permanent care if this resident entered the service as a permanent admission.

#### Permanent resident

A resident who is admitted to residential aged care for permanent care (long-term care).

#### **Place-day**

A day on which a care recipient is occupying a place and the provider is paid an Australian Government subsidy. The day that a care recipient enters residential aged care and the day he or she leaves are counted as one day.

#### Remoteness

The remoteness classification used in this report is based on the ASGC Remoteness Structure developed by the Australian Bureau of Statistics. This categorises all Census Collection Districts (CDs) in Australia according to their remoteness, based on physical road distance to the nearest urban centre. Remoteness is measured by the Accessibility/Remoteness Index of Australia (ARIA) (ABS 2009a). The structure of the classification is as follows:

CDs with an average ARIA index value of 0 to 0.2		
CDs with an average ARIA index value greater than 0.2 and less than or equal to 2.4		
CDs with an average ARIA index value greater than 2.4 and less than or equal to 5.92		
<i>Remote</i> CDs with an average ARIA index value greater than 5.92 and less than or equal to 10.53		
CDs with an average ARIA index value greater than 10.53.		

#### Resident

A person who has been assessed by an ACAT as requiring residential care and who resides in an Australian Government-funded aged care service.

#### **Resident Classification Scale (RCS)**

An instrument which assesses a care recipient's care needs. This scale has eight classification levels ranging from low-care (RCS 8) to high-care (RCS 1), with each level having a specified subsidy level which is paid to the provider for providing the required care to the care recipient. The RCS was introduced with the amalgamation of hostels and nursing homes into one system of care on 1 October 1997, replacing the Resident Classification Instrument for nursing homes and the Personal Classification Assessment Instrument for hostels. The RCS was replaced by the ACFI from 20 March 2008.

#### **Residential aged care service**

A service that consists of a number of approved places at a specific location.

#### **Residential care**

Personal and/or nursing care that is provided to a person in a residential care service in which the person is also provided with accommodation that includes meals, cleaning services, furniture and equipment. The residential aged care service must meet certain building standards and appropriate staffing in supplying the provision of that care and accommodation.

#### **Respite admission**

A short-term admission to residential aged care for respite care purposes.

#### **Respite care**

Care given as an alternative care arrangement with the primary purpose of giving the carer or a care recipient a short-term break from their usual care arrangement.

#### **Respite resident**

A resident who is admitted to residential aged care for respite care.

#### Separation

Occurs when a resident leaves residential aged care and has not re-entered the same or another service within 2 days.

#### Separation day

The last day of a person's stay in an aged care service; that is, the day on which the person leaves the service. Transfers between services were not viewed as separations in terms of length of stay calculations if the time between leaving one service and entering another was less than 2 days.

#### Separation mode

Indicates the destination of a resident at separation, including death.

#### **Supported resident**

Following the Aged Care Amendment Act 2008 clients entering permanent residential aged care with assets below a certain level are eligible to be supported residents (on or after 20 March 2008). The client's level of assets determines the amount of any accommodation charges they pay (see Appendix 7).

#### System for the Payment of Aged Residential Care (SPARC)

The current payment system for residential aged care.

#### Transfer

Occurs where a person leaves an aged care service on 1 day and is admitted to another within 2 days.

#### **Usual housing status**

Refers to housing tenure before the resident's application for admission to residential aged care.
