The Australian Institute of Health and Welfare is Australia's national health and welfare statistics and information agency. The Institute's mission is better information and statistics for better health and wellbeing.

National Breast and Ovarian Cancer Centre (NBOCC) is Australia's authority and source of evidence-based information on breast and ovarian cancer. Funded by the Australian Government, NBOCC works in partnership with health professionals, cancer organisations, researchers, governments and those diagnosed to improve outcomes in breast and ovarian cancer. NBOCC plays a vital role in the translation of worldwide cancer research into meaningful and evidence-based information to guide the work of Australian health professionals, improve health service delivery, inform people with breast or ovarian cancer about all aspects of their diagnosis and treatment, inform policy and raise community awareness about these diseases. For more information, visit <[www.nbocc.org.au](http://www.nbocc.org.au)>.

# Foreword

*Ovarian cancer in Australia: an overview, 2010* brings together in one volume the most up-to-date statistical information available on the epidemiology, public health and health services impact of ovarian cancer in Australia. These data, collected through population-based cancer registries and other sources, are central to advancing our efforts to understand and ultimately control this disease. This report not only builds on previous monitoring reports but additionally provides data about the burden of disease due to ovarian cancer, as well as survival from ovarian cancer by Indigenous status and by histology types.

*Ovarian cancer in Australia: an overview, 2010* also represents the significant contributions and the continuing partnership of National Breast and Ovarian Cancer Centre (NBOCC), the Australian Institute of Health and Welfare (AIHW) and the Australasian Association of Cancer Registries (AACR) and it highlights the importance of registries as a national resource. The report provides a nationwide snapshot of a major condition affecting a substantial number of Australian women.

The value of data and monitoring is its relevance to outcomes and its capacity to impact on change. This report identifies areas of significant gain over time and provides some predictions for the future. Our ability to plan for services and patient needs are predicated on this understanding of the impact of the disease as it affects our population.

We would like to thank the staff of the various cancer registries and data repositories. It is through their effort and diligence that these data are available to the Australian public. We anticipate that the information contained in *Ovarian cancer in Australia: an overview, 2010* will be used extensively to further reduce mortality from ovarian cancer and improve the wellbeing of women with the disease.

# Acknowledgments

This report was commissioned by National Breast and Ovarian Cancer Centre (NBOCC). Advice on content was provided by Professor Tom Dodd and Professor Peter Russell, with additional input from Ms Margot Osinski. Special thanks are due to Dr Penny Webb and Clinical Associate Professor Peter Grant, who reviewed the report. The following NBOCC staff are acknowledged for their contribution to the development of this report: Professor David Roder; Dr Helen Zorbas; Ms Rosemary Wade; Ms Jane Francis; and Associate Professor Christine Giles. The work of NBOCC is funded by the Australian Government Department of Health and Ageing.

This report was prepared by staff in the Cancer and Screening Unit of the Australian Institute of Health and Welfare (AIHW). The main authors were Dr Adriana Vanden Heuvel and Ms Anne Ganner Bech. The main data analyst was Ms Candice Rabusa. Other AIHW staff who made a substantial contribution are, in alphabetical order, Ms Chun Chen, Dr Brett Davis, Ms Melissa Goodwin, Mr David Meere, Ms Galina Prosselkova, Dr Mark Short, Ms Christine Sturrock and Ms Kun Zhao. The authors would like to thank those AIHW staff who commented on earlier drafts of this report.

The support of the Australasian Association of Cancer Registries in both providing data and reviewing the draft report is gratefully acknowledged.

# Executive summary

Although a relatively uncommon cancer, ovarian cancer is often diagnosed at a stage where the cancer has spread beyond the ovary. Such cases often have a poor prognosis.

*Ovarian cancer in Australia: an overview, 2010* provides a comprehensive picture of national statistics on ovarian cancer using a range of data sources, with the latest available data and trends over time presented. Throughout this report, the term 'ovarian cancer' refers to invasive ovarian cancers; borderline tumours are not included.

## **The number of ovarian cancer cases is increasing**

In 2006, ovarian cancer was the ninth most commonly diagnosed cancer among Australian women (excluding non-reportable skin cancers) and the second most commonly diagnosed gynaecological cancer, with a total of 1,226 ovarian cancer cases diagnosed. Ovarian cancer is mainly a disease of postmenopausal women, with six in ten (60%) cases diagnosed in women aged 60 years and over.

The number of ovarian cancer cases increased by 47% between 1982 and 2006 (from 833 cases to 1,226 cases) due to an ageing and growing population. It is anticipated that the number of new cases will continue to increase, with an estimated 1,434 women expected to be diagnosed with ovarian cancer in 2015.

Nonetheless, the age-standardised incidence rate of ovarian cancer decreased significantly by 14% between 1982 and 2006 (from 12.4 to 10.7 new cases per 100,000 females).

## **The rate of death from ovarian cancer has fallen**

A total of 795 women died from ovarian cancer in 2006, making it the sixth most common cause of cancer-related death for Australian women, and the most common cause of gynaecological cancer death, representing over half (55%) of such deaths.

The age-standardised mortality rates for ovarian cancer decreased significantly by 26% between 1968 and 2006 (from 9.1 to 6.7 deaths per 100,000 females). In addition, the 2006 mortality rate was the lowest rate observed for any year to date. Possible reasons for the decrease in the mortality rate over time include the observed decline in the incidence rate, improvements in access to and quality of treatments, and change over time in the types of ovarian cancers occurring among women. However, the data also indicate that the decline in the mortality rate was not observed for all age groups, with the ovarian cancer mortality rate for older women (those aged 70 years and over at death) increasing rather than decreasing over the period considered.

## **The prognosis of women with ovarian cancer has improved**

The prognosis for women with ovarian cancer is relatively poor. Women who were diagnosed with ovarian cancer between 2000 and 2006 were 40% as likely to live five years after diagnosis as their counterparts in the general population. Significantly poorer survival was seen for older women, with 5-year relative survival estimates ranging from a high of 86% for those aged less than 30 years when diagnosed with ovarian cancer to a low of 15% for those aged 80 years or older at diagnosis. Possible reasons for poorer survival of older women include a greater likelihood that these women were diagnosed with advanced stage cancer and/or with more-aggressive types of cancers, as well as a greater likelihood of

co-morbidities. Differences by age in the treatment provided to those with ovarian cancer are also believed to be a factor.

Improvement in the prognosis of those diagnosed with ovarian cancer has occurred over time, with the 5-year relative survival rate increasing significantly from 33% in 1982–1987 to 40% in 2000–2006. Nonetheless, the improvements in survival were focused on women in the middle age groups, with no significant change in the survival estimates over time for those aged less than 40 years and those aged 80 years and over.
