## 9 Procedures for admitted patients

## Introduction

The *National Health Data Dictionary* version 9.0 (NHDC 2000) defines a procedure as a clinical intervention that is surgical in nature; carries a procedural risk; carries an anaesthetic risk; requires specialised training; and/or requires special facilities or equipment only available in an acute care setting. Procedures therefore encompass surgical procedures and also non-surgical investigative and therapeutic procedures such as X-rays and chemotherapy.

Procedures for 2000–01 were classified, coded and reported to the National Hospital Morbidity Database by all States and Territories using the second edition of the *International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification* (ICD-10-AM) (NCCH 2000). Information about the quality of the ICD-10-AM coded data is presented in Appendix 3.

One or more procedures can be reported for each separation in the National Hospital Morbidity Database, but procedures are not undertaken during all hospital admissions, so only a proportion of the separation records includes procedure data. For example, procedures were reported for only 38.0% of separations with a principal diagnosis within the *Certain infectious and parasitic diseases* chapter.

There are two types of data on procedures presented in this chapter:

- data on the separations for which there was one or more procedures reported within the group of procedures (an ICD-10-AM procedure block, group of blocks or chapter) being considered. Because more than one procedure can be reported for each separation, the counts for these data are not additive, so totals in the tables will not usually equal the sum of counts in the rows; and
- data on the total number of procedures reported. For these data, all procedures within a group of procedures being considered are counted, even if there is more than one reported for a separation.

The procedure classification is divided into chapters by anatomical site and within each chapter by a 'superior' to 'inferior' (head to toe) approach. These groups are divided into more specific procedure groupings, beginning with the least invasive procedure through to the most invasive. The blocks, which are numbered sequentially, group the very specific procedure codes. The tables and figures in this chapter use the groups of blocks, blocks and abbreviated descriptions. Full descriptions of the categories are available in the ICD-10-AM publication.

Most of the information is presented using three methods of grouping procedures based on the ICD-10-AM procedure classification:

- ICD-10-AM procedure chapters these 20 groups provide information aggregated at the ICD-10-AM chapter level (Figures 9.2 and 9.3);
- ICD-10-AM procedure block groupings these 65 groups were chosen to provide more detailed information than ICD-10-AM chapters, but still cover the entire procedure

classification at a manageable level (Tables 9.1 to 9.4). Tables 9.6 and 9.7 present counts of all procedures using these groupings; and

• ICD-10-AM blocks – these 1,594 categories describe procedures at a quite specific level. Detailed information is presented for the 30 of these groups with the highest number of separations (Tables 9.8 to 9.16) and summary information is provided for all of the groups (for which separations were reported) on the Internet at http://www.aihw.gov. au/publications/hse/ahs00-01/index.html (Tables S9.1 and S9.2).

In addition, Table 9.5 presents information on the number of procedures reported.

Tables are presented with summary separation, patient day and average length of stay statistics for public and private hospitals and for public patients, nationally and by State and Territory. National information on age group and sex distributions for the 30 ICD-10-AM procedure blocks with the highest number of separations is also presented.

Some data for private hospitals in Tasmania and the Australian Capital Territory have not been included in Tables 9.4, 9.7, 9.12 and 9.14. The data were supplied but were not published for confidentiality reasons. Victoria was not able to supply data on procedures for their public psychiatric hospitals, while Western Australia and Tasmania supplied data on procedures for only a proportion of the separations in their public psychiatric hospitals.

Overall, there were 4.8 million separations for which a procedure was reported, 78.8% of total separations. Eighteen million patient days were reported for separations with a procedure, 78.4% of the total.

# Procedures and other data elements reported for separations

The information on procedures reported in this chapter is compiled in the National Hospital Morbidity Database with a range of other data. Figure 9.1 demonstrates this using the example of a procedure (Block 913 *Colectomy*) and other data elements in the National Hospital Morbidity Database. There were 10,737 separations for which colectomy was reported, with an average length of stay of 14.7 days. Over 57% of separations with this procedure were in the public sector and 50% of separations were for public patients. A large proportion of patients (84.0%) with this procedure had a separation mode of *Other*, suggesting that these patients went home after separation from the hospital. However, for 4.8% of patients the separation mode was *Died*, in comparison to 1.1% in hospitals overall (Table 6.13). The principal diagnosis mostly associated with this procedure was C18.0 *Malignant neoplasm of caecum* (1,361 separations) and the most commonly reported AR-DRG was G02B *Major small and large bowel procedures without catastrophic complications and comorbidities* (6,005 separations). Fifty-three per cent of separations were females and for 88.2% of separations, the patients were aged 45 years or over.

## **ICD-10-AM** chapters

Figures 9.2 and 9.3 provide a summary of the number of separations and patient days by sector, reported for each of the ICD-10-AM procedure chapter groupings.

The highest number of separations in the public sector was for *Procedures on the urinary system*, followed by *Procedures on the digestive system*. In the private sector, *Procedures on the* 

*digestive system* had the largest number of separations, followed by *Procedures on the musculoskeletal system*.

The highest number of patient days in the public sector was reported for *Imaging services*, followed by *Non-invasive*, *cognitive and interventions*, *not elsewhere classified*. In the private sector the highest number of patient days was reported for *Non-invasive*, *cognitive and interventions*, *not elsewhere classified*, followed by *Procedures on the digestive system*.

For both sectors combined, the two chapters with the highest number of separations for procedures were *Procedures on the digestive system*, followed by *Procedures on the urinary system*. The two chapters with the largest numbers of patient days were *Non-invasive, cognitive and interventions, not elsewhere classified* and *Imaging services*.

Procedures were reported for varying proportions of separations in the ICD-10-AM principal diagnoses groups. High proportions of separations for *Diseases of the eye and adnexa* (97.8%, 164,374), *Neoplasms* (94.6%, 421,241), *Diseases of the blood and blood-forming organs* (92.9%, 60,041), *Diseases of the musculoskeletal system and connective tissue* (90.0%, 302,582) and *Diseases of the digestive system* (88.7%, 656,220) had procedures reported. In contrast, procedures were reported for smaller proportions of separations with principal diagnoses in the *Certain infectious and parasitic diseases* (38.0%, 33,946) and *Mental and behavioural disorders* (38.2%, 97,249) chapters.

#### **Broad procedure groupings**

#### Sector

Public hospitals accounted for 58.1% of the separations for which a procedure was reported, although they accounted for 63.0% of the separations overall (Tables 9.1 and 9.2). Similarly, although 70.0% of overall patient days were in public hospitals, only 67.5% of patient days associated with procedures were in public hospitals. In public hospitals, 72.6% of total separations involved a procedure (2,809,141), and these separations were associated with 75.6% of total patient days (11,892,210) (Table 9.1). In contrast, 89.2% of total separations in private hospitals involved a procedure (2,026,419), and these separations were associated with 85.0% of total patient days (5,729,283) (Table 9.2). About 86% of separations with a procedure in public hospitals were for public patients, in contrast to just 4.2% in private hospitals.

The private sector reported a higher proportion of separations for 'same day procedures' than the public sector. About 52% (1,460,688) of separations for which a procedure was reported were same day in public hospitals, compared with 61.9% (1,253,650) in private hospitals (Tables 9.1 and 9.2).

Excluding *Administrative/clinical/client support interventions* (Blocks 1909–1915) (1,011,079) and *Generalised allied health interventions* (Block 1916) (668,511), the group of procedures that accounted for the largest number of separations in public hospitals was *Procedures on kidney* (Blocks 1040–1063), which includes haemodialysis. There were 517,046 separations for which procedures in this group were reported, accounting for 724,248 patient days. This group of procedures also accounted for a large number of same day separations (495,429) and public patient separations (459,426).

After *Administrative/clinical/client support interventions* (Blocks 1909–1915) (1,132,767), *Other procedures on abdomen, peritoneum and hernia* (Blocks 983–1011), which includes panendoscopy was the group of procedures that accounted for the largest number of

separations in private hospitals. There were 267,925 separations for which procedures in this group were reported, accounting for 585,022 patient days. This group of procedures also accounted for a large number of same day separations (199,930). Other groups of procedures that accounted for a large number of separations in private hospitals were *Procedures on large intestine* (Blocks 904–925) (251,933) and *Generalised allied health interventions* (Block 1916) (246,693).

#### **States and Territories**

Tables 9.3 and 9.4 contain detail on the pattern of hospital use in the States and Territories by procedure grouping, in both the public and private sector. These tables enable State by State comparisons of overall hospital use for the different procedure groupings, and the share of separations between the private and public sector. For example, the proportion of total separations for *Procedures on skull, brain and meninges* (Blocks 1–28) performed in public hospitals in comparison to private hospitals was higher in New South Wales (80.5%, 2,958) than in Queensland (63.1%, 1,206). In contrast, the proportion of total separations for *Procedures on lens* (Blocks 193–203) performed in private hospitals in comparison to public hospitals was higher in Queensland (81.1%, 21,528) than in South Australia (59.0%, 6,589).

## Number of procedure codes

Table 9.5 presents information on the number of procedure codes reported to the National Hospital Morbidity Database. There were marked differences between the States and Territories in the maximum number of procedures reported (for example, 31 procedures for Queensland and Western Australia and 20 for New South Wales); however, with the exception of the Northern Territory, the average number of procedure codes per separation varied little among the jurisdictions, for both the public and private sectors. The Institute requested a maximum of 31 codes, so this may have restricted the number of codes reported by Queensland and Western Australia.

In the public sector 5.7% of records had five or more procedure codes, but in the private sector 5.1% of records fell into this category. This may have been due to more complicated cases being treated in public hospitals, or differences in coding practices between the sectors.

## **Total procedures**

Tables 9.6 and 9.7 provide counts of all the procedures reported for 2000–01, by State and Territory for the public and private sectors. The totals are the total number of procedures, rather than the total number of separations or separations for which a procedure was reported. In total there were 10.8 million procedures reported, 6.2 million in the public sector and 4.6 million in the private sector. The most commonly reported procedure group in public hospitals and private hospitals combined was *Administrative/clinical/client support interventions* (Blocks 1909–1915) (2,244,626). A block which accounted for many of these was *General anaesthesia* (Block 1910), 67.8% of the group overall (1,522,350). This was followed by *Generalised allied health interventions* (Blocks 1916) (1,524,619) and *Therapeutic interventions* (Blocks 1867–1908) (642,929), with *Transfusion of blood and gamma globulin* (Block 1893) accounting for 31.8% of the group overall (204,578).

After *Administrative/clinical/client support interventions* (Blocks 1909–1915) and *Generalised allied health interventions* (Block 1916), the most commonly reported procedure group in public hospitals was *Procedures on kidney* (Blocks 1040–1063) (519,078), while in private hospitals it was *Other procedures on abdomen, peritoneum and hernia* (Blocks 983–1011) (276,456).

## High volume procedures

#### Sector

Tables 9.8 to 9.14 present information on the most common procedures (at the block level of the ICD-10-AM classification).

Tables 9.8 and 9.9 contain summary separation, patient day and average length of stay statistics for the 30 blocks with the most separations in public and private hospitals. While Table 9.10 contains summary separation, patient day and average length of stay statistics for the 30 blocks with the most separations in private free-standing day hospitals only.

In the public sector, the most common procedure blocks were *General anaesthesia* (Block 1910) (744,210) and *Generalised allied health interventions* (Block 1916) (668,511) (Table 9.8). Separations for which *General anaesthesia* (Block 1910) was reported as a procedure had an average length of stay of 4.0 days and the proportion of separations that were same day separations was 40.5% (301,148), while the average length of stay for *Generalised allied health interventions* (Block 1916) was reported for separations with procedures within the *Generalised allied health interventions* (Block 1916) group (7,641,889), followed by separations with *General anaesthesia* (Block 1910) (2,968,850) reported as a procedure. The longest average length of stay among the 30 blocks with the most separations in public hospitals was for *Continuous ventilatory support* (20.6 days).

The most frequently reported procedure group in the private sector was also *General anaesthesia* (Block 1910) (723,847), with the second most frequent being *Sedation* (Block 1911) (401,629) (Table 9.9). The procedure group reported in association with the highest number of patient days (2,503,761), *Generalised allied health interventions* (Block 1916), also had the longest average length of stay (10.1 days).

*Sedation* (Block 1911) was the most frequently reported procedure group in private freestanding day hospitals (99,958), followed by *Panendoscopy with excision* (Block 1008) (51,260) (Table 9.10). Over half of the separations for *Haemodialysis* (Block 1059) in private freestanding day hospitals were for public patients (4,865).

#### **States and Territories**

There was some variation between the States and Territories in the relative number of separations for the most common procedure blocks (Tables 9.11 and 9.12). For example, in the public sector, Western Australia had relatively low numbers of separations with *Evacuation of uterus* (Block 1267) (2,871) in comparison to other States and Territories, while the proportion of total separations for which *Haemodialysis* (Block 1059) was reported was greatest for the Northern Territory (33.1%, 19,536). In the private sector, Victoria had relatively high numbers of separations with *Panendoscopy* (Block 1005) (22,387), while the number of separations with *Fibreoptic colonoscopy with excision* (Block 911) was relatively low in South Australia (5,675) in comparison to other States and Territories.

There was also some variation between the States and Territories in the average length of stay for separations reported with the most common procedure blocks (Tables 9.13 and 9.14). For example, in the public sector, the average length of stay for separations with *Panendoscopy* (Block 1005) ranged from 4.1 days in South Australia to 8.1 days in the Australian Capital Territory. Similarly, the average length of stay for separations with *Caesarean section* (Block 1340) ranged from 4.8 days in Queensland to 7.1 days in the Northern Territory. In the private sector, the average length of stay for separations with *Generalised allied health interventions* (Block 1916) ranged from 8.5 days in South Australia to 12.7 days in Western Australia, while the average length of stay for separations with *Examination procedures on bladder* (Block 1088) ranged from 1.7 days in New South Wales to 2.5 days in Western Australia.

#### Age group and sex

There was little difference between males and females in the proportion of separations with procedures, with males reporting 79.3% (2,255,007) and females reporting 78.4% (2,580,515) (Tables 9.15 and 9.16). Eightteen of the top 30 procedures were common to both sexes, while some others were more sex-specific, for example, *Medical or surgical induction of labour* (Block 1334). For both males and females, the group of procedures with the most separations was *General anaesthesia* (Block 1910), with the most separations for this group of procedures in the 35 to 44 years age group.

For males, the highest number of separations with procedures was reported for the 65 to 74 years age group (435,638, 85.8%) (Table 9.15). However, there was a great variation in the age distribution for the different blocks. For example, *Myringotomy* (Block 309) was most commonly reported as a procedure for males aged from 1 to 4 years and was the second most commonly reported procedure block for this age group (10,726). In contrast, *Haemodialysis* (Block 1059) was most commonly reported for males aged 65 to 74 years and was also the most commonly reported procedure block for this age group (89,778). For females, the age group with the highest number of separations with procedures was the 25 to 34 years age group (387,405, 73.3%) (Table 9.16). Common procedure groups among females aged 25 to 34 years were in relation to labour and delivery, for example *Postpartum suture* (Block 1344) (46,897) and *Medical or surgical induction of labour* (Block 1334) (42,072). Procedure groups such as *Generalised allied health interventions* (Block 1916), *Extracapsular crystalline lens extraction by phacoemulsification* (Block 197) and *Transfusion of blood and gamma globulin* (Block 1893) were more common among older females.

## Additional data

The accompanying tables on the Internet at http://www.aihw.gov.au/publications/ hse/ahs00-01.html provide information on the number of separations by five-year age group and ICD-10-AM procedure grouping for males and females, as well as national summary statistics for public and private hospitals for each procedure block (as presented for the top 30 procedure blocks in Tables 9.8 and 9.9). For confidentiality, the statistics for some blocks in the private sector have been suppressed. The information was suppressed if there were fewer than 50 private hospital separations reported for the block and there were fewer than three reporting units (hospitals, or States or Territories where the hospitals were not individually identified), or there were three reporting units and one contributed more than 85% of the total separations, or two contributed more than 90% of the separations for the block.

Note: Main abbreviations: ALOS-average length of stay, W-with, W/O-without, Cat-catastrophic, CC-complication or comorbidity, O.R.-operating room. Figure 9.1: Interrelationships of a procedure (Block 913 Colectomy) with other data elements, all hospitals, Australia, 2000–01

	Procedure blocks	Separations	sebarations	Same day Public patient poarations separations	per 10,000 population	davs	per reject	(davs)	same dav
